

DESIRE

TAKE MY MONEY!

Here is where we keep an eye on crowdfunded projects that will make you go 'Shut up and take my money!'

Penna

You don't normally see standalone keyboards made just for smartphones or tablets. Well not frequently anyway, and most of them aren't that good. The Penna Bluetooth keyboard aims to address that problem. The first thing that stands out about the Penna is its look. It has a very distinct retro look, which gives it a very typewriter vibe. It's also aimed at providing a comfortable typing experience, boasting the feel of a mechanical keyboard. Penna features a choice of diamond shaped or chrome shaped keycaps. The first helps with typing while the second enhances the retro look. Penna utilises Cherry switches, the kind used in mechanical keyboards, to ensure your typing experience is as good as it gets. It also comes with a Macro Bar which lets you map frequently used keys and words to it. It comes with Bluetooth 4.2 support and can be paired with up to five devices. It supports all OSes, as long as you have a device that can use Bluetooth, Penna should work. The Penna Bluetooth keyboard can be found on Kickstarter.

Gnarly Racers

Ever wondered what it would look like if you slapped a camera on to an RC car? The guys at Gnarly have done exactly that so now you can drive them around your house while enjoying a first-person-view from the car's perspective. A Gnarly Racer boasts top speeds of 32 km/h! That's pretty impressive for an RC car, and you get to experience it in FPV. Gnarly Racers will come in a 'Ready-to-Race' kit which includes just about everything you'll need.

You've got the option of a FPV monitor or goggles to best enjoy the FPV experience a Gnarly Racer provides. Unfortunately, Gnarly Racers don't ship to India, so if you've got relatives abroad, it's time to get in touch with them.

Superscreen

There could be several reasons someone might prefer a larger screen. Some might prefer a larger space to work with, and some might simply just want a larger screen to watch stuff on. Now, some might argue that there's tablets for that. True, but you can't carry a tablet around as easily as a smartphone – they don't really fit into pockets. This is where Superscreen comes in. Superscreen is a 10.1-inch HD display for your phone. It lets you wirelessly transmit your mobile device to it, scaling it to its much larger display. Once you've transmitted your device to Superscreen, you can use it just as you would the device. On top of that it doesn't use any data of its own, so there's no subscription fee either. It boasts full multi-touch, orientation control and stylus support as well. They also promise perfect scalability, so no stretching and zooming. And all of that for just \$119 (₹7700 approx.) on their Kickstarter page.
