

ZeTime

ZeTime claims to be the world's first hybrid smartwatch which uses mechanical hands and a full round color touchscreen. What we have here is something quite unique – a watch that blends the classic watch design with the features of a modern smartwatch. ZeTime's front has four layers to it – at the base you have the TFT colour display. The mechanical hands (the second layer) are placed after this, followed by the

touch panel. And lastly, you have the resilient Gorilla glass layer. Unlike regular watches where the hands are controlled by gears running in the background, ZeTime's hands are controlled by the watch's CPU. It also moves the hands to maximise visibility on

the screen as necessary depending on what you're doing. In addition to having all the features of a regular smartwatch, this Swiss-made watch also has its classic look going for it. The best part? At just \$139 (₹9000 approx.), it's not too expensive either. Find ZeTime on Kickstarter.

Kudrone

Kudrone is a palm-sized drone that can record in 4k, comes with GPS auto-follow and is capable of shooting panoramic 3280 x 2464 px photos. This mini drone is easy to use, so you won't be needing any prior drone-handling expertise. Kudrone comes with interchangeable, rechargeable batteries with the option to purchase a charging dock as an add-on. The dock can charge up to three batteries at once and the add-on itself comes with three additional batteries. Some of the other specs in this little drone include an accelerometer gyro, magnetic compass, SONAR hovering assistance, and a vision positioning sensor. For a \$129 (₹8,300 approx.) drone, those features are almost too good to be true. Kudrone can also automatically sync its photos and videos to your iPhone or Android phones' storage. Interested in getting your own mini-drone? Find Kudrone on Indiegogo.

Travis

Here's a handy gadget that every frequent traveller would love to have. Travis is a personal voice translator that's capable of translating and communicating in over 80 languages! There are over 6,500 languages on this planet (half of them are probably from here), yet a surprisingly high number of us speak only one or two languages.

Woops, we're digressing! Back to Travis. Travis is a pocket-sized AI device. It's able to instantly recognise up to 80 languages and offer instant translations, in just two seconds! If you don't have any connectivity, it can voice translate 20 languages. If you happen to have earphones or headphones with Bluetooth, you can pair it with Travis (there's no jack unfortunately). There's a lot of phone apps out there that offer similar services but Travis is built specifically for face-to-face interactions and you're less likely to fumble when all you need is one touch. You can get your own Travis for \$139 (₹9000 approx.) on Indiegogo.

iSpin

Fidget gadgets seem to be all the rage right now. Ironically, fidgeting used to be considered a bad habit. Now, it's being considered therapeutic. To that end, here's another bauble for you to fidget around with – the iSpin spinner. What makes iSpin different from other fidget spinners out there? The folks who made the iSpin wanted to create a high quality fidget spinner, but at an affordable cost. So they did, using Brass, which is better than the cheap plastic ones out there. iSpin is made out of ten CNC brass parts and one stainless steel R188 bearing and can be fully dismantled. This allows you to mess around with the balance by removing and adding the brass parts. Since it can be fully dismantled, you can replace the parts as needed if you happen to break or misplace them. Head to their Indiegogo page if you want an iSpin spinner of your own.
