

08 COPY EFFICIENTLY

What Ditto does for the clipboard, Teracopy does for copying of files – that is, it makes it a heck of a lot easier. Copying large queues of files is a pain with normal Windows Explorer, but not with Teracopy (<http://dgit.in/TeraCopyWin>). It also offers file verification, queues up transfers smartly, and can skip past errors and finish the list instead of dying midway. It replaces the default Windows copier, which means no extra keys to remember or use.

09 SCRIPT LIKE A PRO

Using AutoHotKey (<http://dgit.in/AHKey>) you can script just about anything. And we do mean, pretty much anything! For example, if you spend a lot of time filling in forms online, all you have to do is script using AutoHotKey and you can automatically fill in your email address in any field using a chosen shortcut. Hate that stupid caps lock key? Change it to do something else. You can also set up mouse gestures to launch specific programs, and best of all, you don't even need to know how to script, because of the large community that uses it, chances are the scripts you want have already been published online. Just download and enjoy!

10 ANALYZE DISK USAGE

Windows 10 has a decent Storage Monitor (Windows Settings > System > Storage), but it doesn't show where the space is being taken up. Get Windirstat (<http://dgit.in/WinStat>) and put an end to that today. You get a nice colour-coded tree diagram of what exactly is taking up your space, and shows you previews of the worst culprits. If you're finding yourself managing your disks often, this is a tool you cannot live without.

GEEK SOFTWARE 101

Although Windows has improved a lot since the days of Windows 98 and XP, there's still a lot left to be desired with the way it handles some things. This is where essential software comes in. As soon as you install Windows, you have to install these 10 apps.

01 EXPLORER++

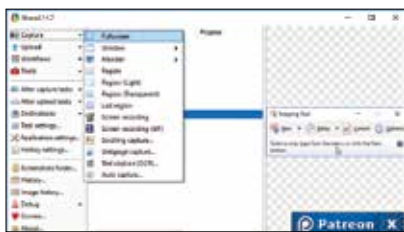

There are many Windows Explorer replacements, but most of them paid, or else so feature rich that they're bloated, and no geek will ever tolerate bloat! (Except maybe

from Adobe, because we have to). Explorer++ has just the right amount of features – a fairly minimalistic UI, a 'details' bar at the bottom, and even full support for browser-like tabs. Get it from <http://dgit.in/ExplrPls>.

02 SHAREX

Windows Snipping Tool is a severely underrated and actually, pretty unknown tool. Being able to screenshot selective parts of your screen is a lifesaver in a lot of situ-

ations. ShareX does this even better. You can instantly save your screenshot, copy it to your clipboard, or even upload to Imgur, all automatically. It's even got a GIF maker inbuilt. Get it at <http://dgit.in/ShareXSC>.

03 PAINT.NET

Paint.net is the best compromise for people who want a wee bit more power than regular Paint, but don't want to jump to something as advanced as GIMP or Photoshop. It has layer support, easy blurring and tons of more functionality with a lots of plugins. Get it at <http://dgit.in/Paintdtnet> and start editing immediately.

04 NOTEPAD++

Notepad++ is a Notepad replacement. While the latter is merely meant to edit plain text, Notepad++ does that and a ton more.

You can edit source files, it's got tabs, and of course also highlights the text according to the language it uses. Get it at <http://dgit.in/NPadPlus>.

05 IRFANVIEW

This is hardly new, or unknown, but it's so good that we have to mention it. Windows Photos is just a simple app. Irfanview offers much more functionality and options, and even has plugin support. You get easy text and watermark insert options, more detailed photo information, precise cropping and much more, without you having to use a separate photo manipulation program, a definite plus for people who need to work with images often. Get it at <http://dgit.in/IrfnView>.

06 FOOBAR2000

Another default Windows app that does the job but is sorely lacking is Groove. Foobar2000 is the go-to 'audiophile' music player for windows, offering native support for FLAC (among other formats), built in file convertor, great customisation options – both visual and audio. Mess around with it until you get a sound you like). Add on a clean interface and you get a crowd favorite. Get it from <http://dgit.in/foobar2k>.

07 CYGWIN

Cygwin is a POSIX (Portable Operating System Interface) that offers most of the functionality that cmd can, and also a host of other useful features. It adds on a distinctive Linux feel to a Windows computer – which makes it geek-cool. So if you're a command-line junkie, get it from <http://dgit.in/CygwinPOSIX>.

08 AUDACITY

Windows Sound Recorder is too basic. You have probably heard of Audacity if you are used to recording stuff, and with good reason. Audacity also lets you record sound from applications, make your own audiobooks, use it as a voice activated memo recorder, and so much more. Even the audio editing features on it are amazing, and actually enough for even advanced use. Get it from <http://dgit.in/AudaRec>.
