

Amplify your phone's eye candy quotient

When it comes to customizing looks, Android beats every other OS hands down. Here's a handy guide to giving your droid a complete makeover.

YELLOW JACKET CASES

For the people out there who want to secure their phones as well as themselves - the Yellow Jacket case is not just a decent protective case for your phone, it's also a stun gun as well! The case plugs into your phone and the 'stunner' is near the top of your phone. A mechanism on the back of the cases reveals or hides the 'stunners' as per need. Perfect for a night out of town in a strange place.

HOOKUPZ 2.0

HookUpz' main goal is to connect your smartphone to the optic of your choice. They don't care what that optic is - binoculars, monoculars, spotting scopes, telescopes, microscopes, borescopes, and any other scope you can think of. This opens up the ability to do a lot of things, like letting you record and capture everything you see digitally and then being able to instantly share what you saw to social media. Go for version 2.0 as it accounts for larger sized phones and phablets too, so you should have no problem fitting your phone in even with its bulky case on.

1BYONE FOLDABLE BT KEYBOARD

In most cases, where we miss our laptops these days, we can make do with our phones. But we do end up missing a QWERTY keyboard sometimes - especially old BlackBerry users. You don't need to buy an overpriced phone to get QWERTY, just use this foldable Bluetooth keyboard instead! If you frequently work on your phone, and edit documents and the like on the go, this keyboard fits right into your pocket, and is about the size of your phone. It works with any Bluetooth-enabled device - iOS, Android, Windows, Mac OS, whatever. It is powered by a rechargeable internal battery with good battery life.

CUSTOMISE YOUR HOME

Another aspect of being a geek is to customise your home, and wow anyone who visits it. Even better if it's not filled with things you bought, but things you built!

this section we will help you build your own ambient lighting hack for your TV, and also give you a few pointers and links to some articles we have done online, which will help you stream media all over your house and automate your home by turning dumb devices into smart ones.

MAKE YOUR OWN AMBILIGHT

Back in the day, when the first LED TV's appeared, Philips came out with a great feature: Ambient TV lighting, which they called "Ambilight". Ambilight consisted of lights that would project on to

TVs with ambient lighting look very good when they can sync with the content on the screen
