

Build a Lego Macintosh

Programmer Jannis Hermanns builds himself a Lego Macintosh Classic that works and he wants you to build one too! <http://dgit.in/legoMAC>

Bugs VS maple

Scientists in Canada are experimenting with a molecule found in maple syrup, and they're getting positive results. <http://dgit.in/MapleBug>

iBall CompBook i360

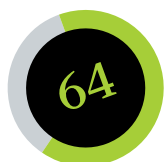

Beast of a battery but needs more performance

With this device, iBall is trying to raise the bar by offering a convertible option at such an affordable price point. Its screen rotates all the way transforming the laptop into a 11.6-inch touchscreen tablet. It's a decent device with a few minor annoyances. For

instance you have to manually kill the keyboard using a switch before flipping to tablet mode. This should've been automatic. Moving on to ergonomics and performance, the keyboard is not very comfortable to type on because of its proximity to the touchpad. Accidental touches were common. There's no ethernet port, which is normal for laptops in this segment. However, we would have appreciated an ethernet-to-USB adapter with the laptop. The iBall i360 runs on an Intel Atom x5-Z8300 SoC which scored 1285, 1384, and 1142 respectively on the PCMark Home accelerated, Creative accelerated and Work accelerated benchmarks – adequate for a device such as the i360 which should ideally be used primarily for light tasks like browsing and Office. If you're looking for a economical laptop just for basic needs you might have other options, but if it's a budget 2-in-1 you want and you just need to have that touch interface, then the iBall isn't too bad.

HIFIMAN HE560

A rare pleasure

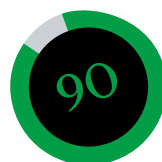

The HIFIMAN HE560 is a beautifully crafted, open-backed, planar magnetic headphone, designed for reference use. Unlike regular dynamic drivers wherein the diaphragm is pushed by the moving coil behind it, planar magnetic diaphragms are encased within opposing magnets and the entire wafer thin diaphragm itself is electrically charged with conductive material to make it move. This makes them durable (less movement), more sensitive, and – to apply a display tech term – their refresh rate is very fast. This makes planar magnetics super accurate and more responsive.

The HE560s are very easy on the eyes. The wood finish ear cups, the smooth metal frame and pleather

headband give them a sophisticated look. Though I wish HIFIMAN had paid a little more attention towards the finishing and build. The cushioned earpads are very comfortable while the headband provides adequate support. The clamping pressure is a little on the tighter side but not uncomfortable. The HIFIMAN HE560 is a delightfully detailed aural experience. Apart from the regular test tracks, I wanted to literally put every piece of music I owned through these cans just to see what new detail I will be able to discover, or what little previously missed nuance would rise to the surface. The 24bit/96kHz fully uncompressed nuforce test samples I've had with me for the past five years never sounded this good. I don't want to gush but the dynamic range on the HE560 is phenomenal. Their sound signature is very close to neutral with supremely tight bass. If you can afford them, and if you have a sufficiently high end source to pair them with, there is absolutely no reason why you shouldn't go for them.
