The Bose QuietComfort 35 is a pair of premium active noise cancellation headphones that are aimed at the higher ranges of mainstream premium personal audio gear. True to its name, the audio delivery is not particularly enthusiastic or peppy, but is smooth, warm and comfortable. The headphones maintain great consistency and composure of audio delivery across most genres, with well-calibrated low frequency performance, sharp and clear mids, and slightly conservative highs.

The bass produced is well-defined, but is not overpowering. The mids are reasonably sharp, but needed a little more emphasis to be pitch perfect. It sounds good across octaves and vocal ranges, but is a tad subdued on overall terms. The highs are the

₹29,363

best bit, being well-measured, and well-detailed. The overall warmth in audio enables comfortable listening, and the sweet timbre adds to the plush audio here. Good soundstaging here is further combined with smooth active noise cancellation to ensure that you get an expansive field of listening, and does not induce claustrophobia.

The noise cancellation is calibrated to add comfort to the listener and not isolate the person, which is a good element here. The headphones are heavier than its predecessor, but are fairly robust. Good connectivity range of over 40 feet and nearly 11 hours of playback time sum up the Bose QC35. Overall, it makes for the most optimally balanced premium headphones to buy in India.

MuveAcoustics Drive

Decent sound, but tips are bad

The Virat Kohli fronted brand MuveAcoustics makes audio gear aimed at the youth. To start off, the Drive in-ear is available in Black, Blue and White. The blue unit that we received definitely looks nice although they don't really inspire too much confidence in terms of build – being extremely light – but they are definitely not flimsy. An interesting thing about the drive was the elaborate box that they came in. If some of that effort and money would have been put into bundling a hardcase, it would've helped.

The flat tangle free cords are a plus. The translucent silicon tips go with the design but hamper the performance. The material lacks the flexibility and the springiness needed to create a good seal. It's quite thin too. Since getting a good seal is difficult, the bass performance suffers

because of the tips. The in-line remote and microphone work well enough. The sound signature on the Drive is bright and sparkly. On some of the bass heavy tracks you quickly notice the low end is lacking. But that could also be because finding a good seal with those paper-like tips is so difficult. The passive isolation is

pretty bad too because the tips are unable to create a good seal. On Chris Rea's *Call On Me* the vocals seemed recessed. The Muve Acoustics Drive (MA-1000SB) isn't a bad sounding in-ear headphone by any measure. It isn't particularly great either. In fact a few critical flaws like the low flexibility silicon tips and non-inclusion of a hardcase take away major points. We recommend you spend another ₹200 and go for the E10C or Twinwoofers M 2.0.
