Samsung Galaxy S8/S8+

Bent to impress

From the Note Edge to the Galaxy S8, Samsung seems to have settled on a functionality for its curved screen - to make its phones look good despite obvious repercussions. The company's tryst with glass continues this year in its best design so far.

The first thing you notice about the Galaxy S8 and S8+ is obviously their design. The curved edges (front and back) and glass on both sides reeks premiumness. But more importantly, there's much more finesse in terms of UI design. Touchwiz is now called the Samsung Experience and it feels lighter and is tastefully done. Icons and notifications look stylish and Samsung has fixed some issues too.

For example, notification icons appear just before where the screen curves, while the game tools icon is integrated into the on-screen keys, instead of a floating bubble. As you probably know already, there's a pressure sensitive home button below the screen, and you get used to it very easily.

The Galaxy S8 is all about ergonomics. It's 5.8-inch Unisium display is tall and narrow, making the phone itself more ergonomic. Even smaller hands would be able to reach across the screen, making it decent for single-handed usage. However, you still have to get used to the slippery glass back on both of these phones. That's even more important on the Galaxy S8+, which is far less ergonomic than the S8. It's compact for a 6.2-inch device, but really not something we'd call ergonomic.

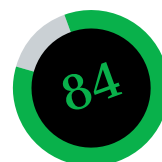

Speaking of ergonomics, that fingerprint sensor was destined for disaster. It's easier to get used to on the Galaxy S8, but we found ourselves using the pin very often on the bigger device. Why use the pin? Because the Iris Scanner and Face Unlock feature aren't dependable enough to be used all the time. Both take a second too long to be called seamless and often do not work in lower light. We couldn't even register our iris on the S8+.

The best feature of the Galaxy S8, as with many Samsung phones, is its display. QHD resolution on both the devices makes them sharp. More importantly, Samsung has toned down colour oversaturation and touch performance is excellent. We found a reddish tint on the Galaxy S8+ from some angles, but the same

didn't happen on the S8. Also, you may see a slight rainbow effect where the screen curves, but that'll disappear if you turn off Edge Lighting from Settings.

Univisium aspect ratio on phones is new, so you'll have to contend with black bars when watching content, at least for now, since videos and movies don't follow this aspect ratio just yet. Samsung has added a button on the recents menu to stretch apps to full screen, which works most of the time but makes some apps tough to use. That's probably why the company didn't forcefully fit all apps to the new display.

Amongst other things that Samsung has put on these devices, the Exynos 8895 is as fast as you'd expect from a flagship SoC. The 10nm chipset runs four of Samsung's Mongoose cores and four Cortex A53 cores. Benchmark scores are amongst the highest we've ever seen, but really, there's not much that dazzles in terms of performance. The Galaxy S8 phones are as fast as flagships should be, and incrementally faster than their predecessors.

Both phones will give you just about a work day's worth of battery life. The PC Mark test puts the bigger phone at over 11 hours, while the S8 comes out to 8 hours. Samsung made no change to the camera, so that remains pretty much what it was last time. Overall, the two phones are great and meant for those looking for a flagship worth showing off.
