Bose wiretapping charges

Illinois man Kyle Zak, accuses Bose of illegally wiretapping him via his Bose QuietComfort 35 wireless headphones. <http://dgit.in/Bose35sue>

Keyboards

settings, you'll always have to keep the software running in the background, as they can't be loaded onto the keyboard. There are slots at the bottom of the keyboard what looks like slots for a palm rest. But the company doesn't pack one in the box, nor does the palm rest from the K70 series fit the K63. Build quality is almost the same in both the keyboards, where the advantage is the dedicated keys on the K63. However, the MasterKeys Pro S has a lower price while offering slightly better features than the K63, ultimately giving it a superior value for money. Only reason you should look into the K63 is if you're a Corsair loyalist and want customisation options through software.

Corsair K70 RGB and K70 Lux RGB

The K70 line-up from Corsair has had a great run right since its Vengeance days. It has evolved drastically with several refreshes in the same model, sometimes with just the branding whereas in this case, a functional update. The K70 RGB was quite popular when it came out, in terms of build quality, features, software support and the most awaited feature – RGB lighting. Over time, Corsair released several other keyboards, and after a lot of feedback and complaints, the K70 was updated with the K70 Lux model. The main update to the K70 Lux is a new controller for better lighting transition effects. While it was expected to have a USB pass-through in the first place, Corsair added it later to the Lux. The font on the keycaps was also replaced with the one found on the STRAFE keyboard. Speaking

of the other tiny differences, the logo on the top has been replaced with the old one (users really hated the new Corsair Gaming logo), extra double-shot moulded keycaps for FPS and MOBA games, and a textured spacebar. Only Corsair has been providing extra double-shot moulded keycaps whereas others offer regular laser etched ones.

Corsair STRAFE RGB

The STRAFE has been another line-up from Corsair following a comparatively minimalist approach to the K70 family. It has an anodised aluminium body that won't accumulate dust unlike the brushed aluminium body on the K70 RGB. The most highlighted feature in this time's STRAFE is the MX Silent switch. Essentially, they are a redefined version of the Cherry MX Red switches with the same actuation force of 45cN. The white reflective paint at the back of the keys is a great move followed by several keyboard manufacturers.

Corsair K95 RGB Platinum

We had the best overall experience on the K95 Platinum in terms of build quality, lighting modes, features, etc. The biggest shortcoming in the other keyboards was that in order to have a custom lighting effect or macros active on the keyboard, you had to keep the software running in the background. If you connected the keyboard to another machine, it wouldn't save to the device except the static lighting on the keys. This holds true for other Corsair keyboards as well. The K95 Platinum is capable of storing three different profiles of lighting effects on the device, but still doesn't support the

storage of hardware macros. You can switch between these three saved profiles using the dedicated profile switch on the top left. Other than that, the RGB lighting is amazing and with the added LED strip on the top, it looks gorgeous. The keyboard

Corsair K95 RGB Platinum

has a sturdy frame including the palm rest. The palm rest has a dual-sided rubber mat which is magnetic. Both the sides have different textures that can be flipped according to your preferences. You can find cable grooves at the bottom meant for cables going to the USB pass-through. Do note, that the keyboard cable won't fit in these grooves. At such a high price, we did expect dual-shot moulded keycaps and that's something Corsair should explore to offer in their most premium line of keyboards.

Gamdias Ares 7 Color (GKB3000)

The Ares 7 Color is another keyboard using the TTC Blue switch, and it has a similar feel to Cherry MX Blue. It doesn't feel as clicky as the Outemu Blue switches but certainly needs more force to register a click. One difference we noticed was the Cherry MX Blue felt smoother. This keyboard doesn't come with RGB lighting but offers a maximum of seven colours that give you an illusion of RGB lighting. You can switch between

the different preset lighting modes based on different game genres. The different lighting modes can also be cycled using the modifiers. There aren't any accessories included in the box, and at this price we expected a keycap puller to be included.

Gamdias Hermes Lite

The Hermes Lite is another basic gaming keyboard with minimal features. It uses the TTC Red mechanical switch inside which feels very similar to Cherry MX Red. You can switch the n-key rollover between 6-key to 21-key but 6-key rollover is more than you'd require. This can be changed using the modifier key or from the software. This keyboard has red LEDs with just a simple breathing effect that can be controlled both from the keyboard and software. Macros are also supported again through the keyboard and on-board macro recording button. The keycaps didn't have a snug fit and wobbled a lot. The attached palm rest could have been broader since it hardly managed to accommodate our palms or wrists while typing. At the time of writing this test, the Hermes Lite was listed for almost its price making it a great keyboard to consider under a small budget.

G.SKILL Ripjaws KM570 RGB

The KM570 RGB is more of a sobered down version
