of the KM780, providing the almost the same level of software customisation for both lighting effects and macro recording. You still get dedicated volume

control keys and on the fly macro recording. Although the keyboard has two USB connectors, it was surprising that it didn't have a USB pass-through. Compared to

the KM780, the RGB LEDs weren't as bright even in the full brightness level. Because of the plastic body, the KM570 RGB flexes compared to the other keyboards with metal

frames. With a budget of around ₹10K, you can surely consider this board as it ships with Cherry MX switches if you don't like TTC switches on the Gigabyte XK700.
