

New GoPro Fusion

The new consumer 360-degree action camera from GoPro can shoot upto 5.2K videos at 30 frames per second. <http://dgit.in/GPFusion>

HTC's squeezable phone

The new HTC U will feature Sense 9 and a new touch-sensitive frame. <http://dgit.in/HTCCocean>

G.SKILL Ripjaws KM780 RGB

a hard case box that also contains a plastic keycap puller. The palm rest is also made of top quality with a textured rubber coating. The entire body of the keyboard is built like a tank, making it the heaviest one in the labs. Software support enables you to further customise the lighting options and recording macros, where it could have used more granular options.

Gigabyte XK700

All the keyboards in this comparison test were black and to be honest, we were quite bored with this colour. But then we saw the brilliant silver metal frame on the Gigabyte XK700 and were mighty impressed. This keyboard also has a small footprint even though it has a standard size of 104 keys. We were surprised after we picked up the keyboard because it felt light in weight compared to the others and we did find that it was in fact the lightest keyboard in the comparison. It's under a kilo in weight, making it more portable. The key-

caps could have been better because they don't have a snug fit and wobble. Just to check, we replaced a few keycaps with the ones on the Corsair K70 and found quite a snug fit. Another interesting aspect to the keyboard was the mechanism to adjust the height of the feet on the bottom of the keyboard. Two dials at the top can be moved for the desirable height. The RGB lighting on the keyboard wasn't as satisfying because it kept flickering a lot. We tried to connect to a different port and even update the firmware but didn't observe any change. Either it could use another firmware update or the controller inside isn't powerful to handle the RGB lighting.

HyperX Alloy FPS

The HyperX Alloy FPS is a keyboard directed towards serious gamers who don't care about fancy lighting or features. The quality of the spongy-meshed carry pouch is great and we would love other keyboard manufacturers to imple-

ment the same. This keyboard is among the most affordable ones with Cherry MX switches, trailing behind the TVS Gold and Cooler Master MasterKeys Pro S. Our biggest and probably the only issue was with the quality of the keycap stem. Certain keycaps used to get stuck midway because of the poor moulding. This won't be an issue after they grind away, but better moulding is necessary. RGB enthusiasts might not be overwhelmed with the keyboard since the per-key lighting is red only. You do get extra keycaps for WASD and 1234, where the WASD keys are textured. The HyperX Alloy FPS is also the thinnest keyboard in this comparison.

Kingston HyperX Alloy FPS

Razer BlackWidow Chroma V1

It's been way too long since we tested Razer keyboards and it was great to get our hands on the popular BlackWidow Chroma V1. Do note, that in this comparison we covered the version one and not the two. Recently, Razer started building their own mechanical switches where earlier they used Kailh switches. Now, they've grown to offer many options and they decided to completely ignore the colour code used by other switch manufacturers. The BlackWidow Chroma V1 we received had the Razer Green switches that feel close to Cherry MX Blues but Razer claims to offer a durability of

a staggering 80 million keystrokes. This is way above Cherry's durability rating of 50 million keystrokes and it will be interesting to observe whether this holds in the long run. Speaking of the keyboard, it has full RGB backlighting with a white backplate to make the LEDs appear brighter. Lighting modes were impressive and the transition was smooth too. Everything can be controlled using the software which is limited so you won't be able to do much. If you aren't comfortable with the software, you can record macros on the fly which is simple. You'll also find extra buttons on the left. If you're a hardcore Razer fan, considering the crazy claim of

an 80 million keystroke durability, you could consider the keyboard but it will be quite heavy on your wallet.

Roccat Suora FX

The Suora FX uses TTC Blue switches inside which are similar to Cherry MX Blue switches, and unlike the Outemu Blue switches, both these feel almost the same. Rated with a durability of 50 million keystrokes, we aren't sure whether it offers the same durability of Cherry MX switches. Among the lot, it's only fair to compare this keyboard with the Gigabyte XK700 due to the similar switches and price of being around ₹10,000. We didn't come across any flaws in the

Gigabyte XK700
