

New Traffic lights built

Russian designer Evgeny Arinin has reimaged the traffic light. These big, bold signs are built for people and robots. <http://dgit.in/botLights>

Volume button for ears

Knops are a new pair of adjustable ear plugs that claims to be "the volume button for your ears". Learn more: <http://dgit.in/Knops>

Keyboards

Razer BlackWidow Chroma V1

keyboard. It has software support and it does have a lot of features to enhance the RGB lighting, adding macros as a modifier key, etc. It's a standard keyboard with additional keys for volume control, with the satisfying minimalist design. Compared to all the keyboards with exposed key switch design, the back-lighting looks impressive on this one, especially in the default rainbow wave and cycle lighting mode.

SteelSeries Apex M800

By design, almost all the mechanical key switches in the other keyboards are the same. The SteelSeries QS1 switches is a relatively new design for mechanical switches, exclusive to SteelSeries. They feel more like a membrane keyboard but because of the short travel distance, it doesn't have the same mushy feeling. Initially, you would be bottoming out the keys and once you get used to the short actuation distance of just 1.5mm, you'll be able to achieve a higher typing speed.

Roccat Suora FX

Speaking of typing, it took us a comparatively longer time to get used to these keys but we weren't able to achieve the same typing speeds recorded on other mechanical switches. The feedback won't be satisfying enough if you're moving from a mechanical keyboard to this one. Nonetheless, it's completely subjective. The key switch design places the RGB LED right at the centre of the switch, resulting in the keycaps shining brighter and smoother. In terms of brightness, the QS1 switches are still dimmer than the white LEDs on the MasterKeys Pro S. The SteelSeries Engine 3 software doesn't offer much customisation options other than lighting and macros. One interesting aspect of the software is GameSense that lights up keys on your keyboard to display your in-game stats such as health and ammo. This brings in a functional use for RGB lighting in the keyboard other than pure aesthetics we're used to seeing. The switches are great for gaming but we highly recom-

mend you to experience them before buying.

BEST PERFORMER

The fight for the best performer seemed clear between two goliaths in this test. It would have either been the G.SKILL Ripjaws KM780 RGB or the Corsair K95 RGB Platinum. While the K95 RGB Platinum did manage to sweep away the highest score in build quality, the KM780 RGB offered so much in terms of features, that it took the glory of winning the "Best Performer" award. Both the keyboards nearly balanced out each other in

the Best Buy award. But the Gigabyte XK700 held quite a number of features and accessories to clinch this title away from them. This keyboard has all the basic features required along with providing several accessories including a metal keycap puller, extra keycaps and a carry pouch. It also has software support and has RGB lighting. Built in a tough plastic and metal frame, the XK700 offers the best value for money out of the lot.

EDITOR'S PICK

Although features are equally important, several features are merely luxuries and can

SteelSeries Apex M800

features and build quality but G.SKILL won by a sliver. The KM780 RGB is one of the best designed keyboards we received with well thought out features that will only act as an added advantage to gamers.

BEST BUY

We were sceptical at first because we had included two ten-key-less variants in this comparison where the competition was against mostly standard sized keyboards. Hence, we didn't include any parameter that favoured the size of the keyboard, whether standard or tenkeyless. With the tenkeyless variants having the lowest prices, we thought one of them would take away

be set aside. A keyboard's build quality is something of great value, placing the Corsair K95 RGB Platinum as the Editor's Pick. The moment we unboxed the keyboard, we were looking at a new benchmark for higher quality components. Right from the brushed Aluminium surface to the heavy-duty dual-sided palm rest, it offered almost everything you would want in a gaming keyboard. The RGB lighting was mesmerising, and with the help of the software you can actually create your own custom lighting effects to any level. With only a few qualms on the software side, using the K95 RGB Platinum was an absolute treat.
