**HTTPS everywhere**

MindGeek announces that both Pornhub and YouPorn are moving from HTTP to the more secure HTTPS. <http://dgit.in/PornSecure>

middle attack and then listen in on your traffic. So what should you be looking for? When you connect to a VPN, there first occurs a handshake wherein information about you is passed onto the VPN's server and authentication details from the VPN are passed onto you. This handshake must be secure. The highest level of encryption any VPN offers for this is RSA-4096. Then comes your traffic as it travels through the VPN, this again should be encrypted by a form of encryption. The highest encryption that you get for your data is AES-256 which is what we'd consider to be the bare minimum for data encryption.

Server location

We've spoken about how location matters. There are a few nations that have pooled together to share intelligence data and some of these nations have international programs which require data logs from one nation to be shared with the others in the program. So should your browsing data enter the geographical boundaries of

any of these nations then it's up for grabs for any of the other nations in the program. We know that the US and the UK are really bad with data privacy. Then there are well known programs such as the Five Eyes, Nine Eyes and Fourteen Eyes, all of which involve sharing data between them. So figure out where the VPN's servers or HQ is located and make sure that it's not situated in the following countries: US, UK, Canada, New Zealand, Australia, Denmark, France, Holland, Norway, Germany, Belgium, Italy, Sweden and Spain.

Speed and protocols

One of the issues that plague VPNs is speed. Since a slow network will bottleneck your traffic, it's imperative that your VPN have high bandwidth within their network. You can easily test this out by subscribing to a trial program that most VPNs offer, then running speedtests while also testing out your experience with your most frequently used websites. The second

thing you should worry about are the different protocols such as P2P protocols, Torrents(also P2P), Multihop, SSH Tunneling, etc., which all of us tend to use sometime or the other. It's not just the protocols, but even select ports are blocked by certain VPNs, sometimes for the sake of security, and sometimes to prevent malicious DDOS attacks. The VPN service's website will usually have an FAQ section outlining all the different measures they undertake to safeguard user privacy, you'll find these details over there.

Any product or service with a lot of features tends to be expensive so if you've shortlisted the very best VPNs that suit your needs, then price is what you need to check next. And this is kind of obvious, so I'm not going to dwell upon this any longer. In case you feel like all of this is a really daunting task, then fret not, one dude took it upon himself to test out multiple VPN services and he's still testing them. You can check out his findings on <https://thatoneprivacysite.net>

Wireless casual gaming

I was looking for a gaming mouse but I don't really have a huge budget. I don't plan on gaming heavily, just casual gaming. I'm looking for something under ₹2,500. Oh, and I compulsorily need a wireless mouse.

– Harshit Nanda

A Hey Harshit,

If you're looking for only casual gaming then you can go for any generic mouse out there since most of them perform the same. We would recommend the Lenovo 500 or Logitech M185 but it might not be comfortable for long gaming sessions. At a lower budget, it's difficult to find good wireless mice for gaming. If you're ready to spend extra money, go for the Logitech G602 or the Razer Mamba.

The best GPU

Hi guys,
I'm trying to build a rig for myself and

I've bought almost every component except the GPU. I've been saving a lot since a long time to build my dream ultra-high-end gaming rig and the GPU has kept me wondering. I was going for the GTX 1080 but then the GTX 1080 Ti was launched. I'm glad I didn't rush into buying but now I'm confused which one should I buy. I'm assembling my rig inside a Corsair Obsidian 900D, so there's no restriction in the card size

The ZOTAC GTX 1080 Ti AMP! Extreme Edition is the most powerful GPU we've ever tested in our labs

because I've enough space inside. Please suggest me the best GTX 1080 Ti that I can buy right now. Along with that, recommend a robust PSU that I can get to last me for several years.

– Mohnish

A Hey Mohnish, we're glad that you're finally ascending in the PC Master Race. We have tested a few GTX 1080 Ti GPUs lately and out of them, the ZOTAC GTX 1080 Ti AMP! Extreme Edition performed the best. With this GPU, you can throw any game at it and have them run smoothly at even 4K ultra settings. You can get it for around ₹70,999. For the PSU, it will be better to go for modular one. Our recommendation is the Seasonic M12II-750 EVO that you can get under ₹10,000.

Budget i5 laptop

Hi, I want a laptop in the range of ₹30,000-40,000. It should have 4 to
