

Free HTTPS with Let's Encrypt

>>Secure your domain and all data transactions with free HTTPS SSL certificates, courtesy of Let's Encrypt> by Mithun Mohandas

Encryption has become a hot topic of discussion these days. Governmental agencies and hackers hate it, and technology evangelists recommend it. Security is absolutely important, no matter which aspect of your online presence is being discussed. On the web, you have multiple forms of encryption and that too, present at different stages. You should be familiar with the HTTPS lock symbol which pops up right at the beginning of the address bar when you visit popular websites like Google, Facebook, Github, etc. It's now mandatory for implementing certain services or modules which involves transmission of personally identifiable information. There will be no online payment page without HTTPS, no gateway's API will even allow you to perform a transaction if that page isn't secured with TLS/SSL.

Many industry titans have started encouraging the use of TLS as well. Let's say you've decided to build your own website, if you have any page that needs a user to submit personal information or even sign into a page, then it's better to have that page secured with an SSL certificate. Or better yet, your entire site. Google started giving websites with HTTPS a little boost in their search rankings back in 2014. They'd stated that they'll promote HTTPS

further to encourage website owners to shift from HTTP to HTTPS. So if all you need to do in order to get a little bit of Google-search-love is implement HTTPS then you can turn to one of the many Certificate Authorities (CA) which issue HTTPS certificates.

There are several types of SSL certificates and they're classified either by Validation Level or by Secured Domains. Let's

*Coding Matters

*Facebook Relay

>> New version of Relay JavaScript framework improves Facebook performance on mobile.
