storage provider and as a consequence, were affected by it. Some of them were HDFC Bank, Citibank, Infibeam, Uber, Zoho and Lenskart. If you had an account on these websites before the breach, it is highly likely that the data was leaked to any random requester who hit the correct server or even used the correct search term on Google.

Overall, according to a report from Gemalto, last year saw a staggering 1.3billion records breached by hackers – that is 44 people losing their information every second, throughout the year. And this doesn't include the 52% breaches where the number of records lost was unknown. Compare that to the fact that the total number of breach instances actually went down by 4% – indicating that the breaches are going wider and deeper in terms of effectiveness. Specifically, India was one of the worst performers. According to the 2016

SBI had to undertake one of the largest debit card replacement drives last year

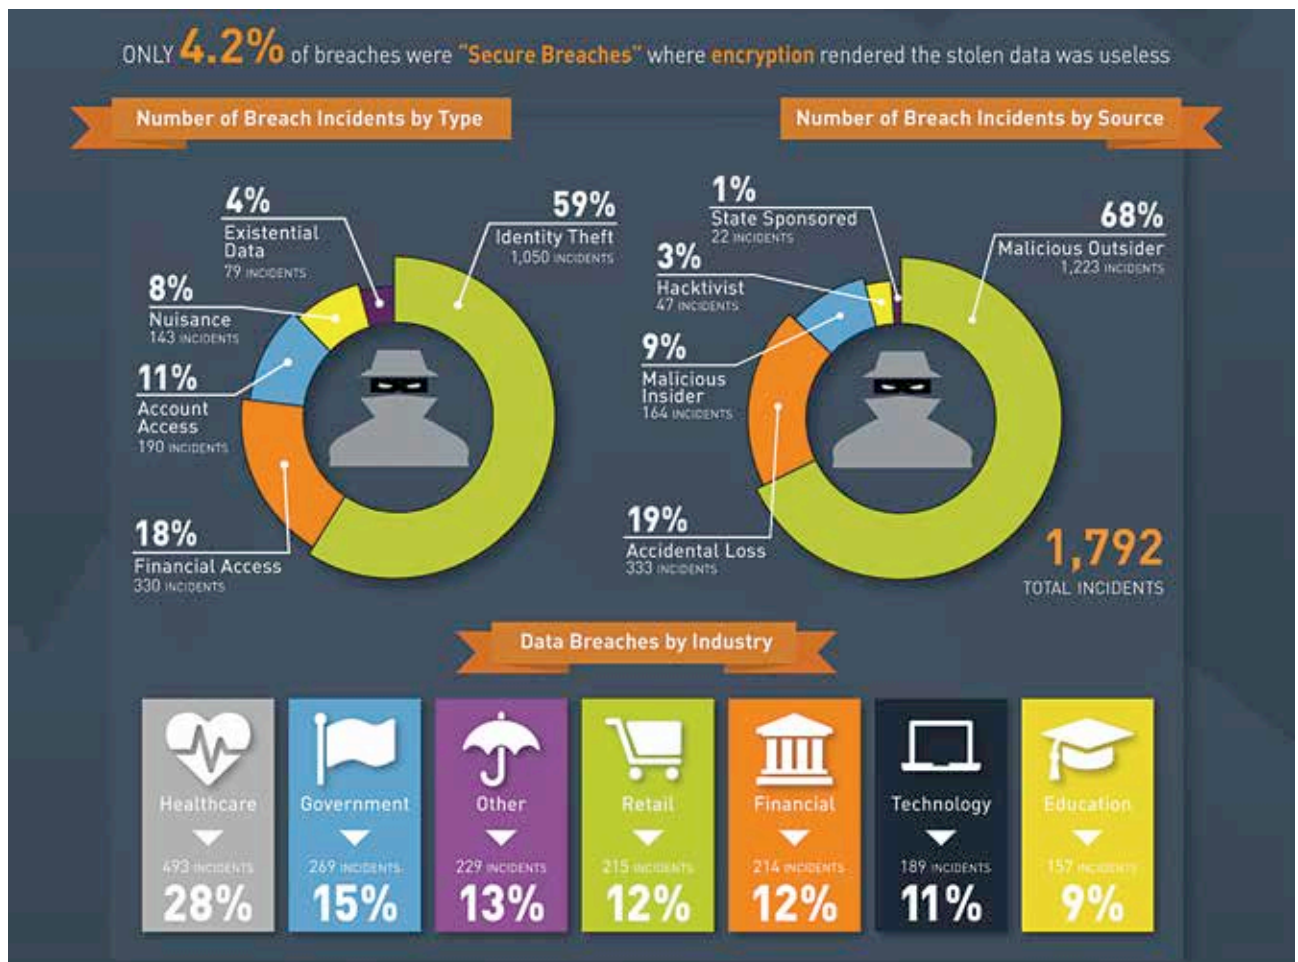

Cost of Data Breach Study from IBM, India had the highest average number of breached records at 31,225 per breach. Interestingly, the same report goes on to point out that India is the global leader when it comes to percentage of breaches caused by system glitches. That does tell you something about the way the tech-

nology behind security is being handled currently in India.

It's a pain

The data you lose to breaches may or may not be vital to you – depending on the severity of the breach. Enterprises, on the other hand, have a higher price to pay. Indian organisations experienced an average loss of \$1.6 million per organisational breach, bringing the cost of each lost record to about \$60. Apart from the economic losses, a data breach or hack also affects the goodwill of a brand with its customers – and we all know how important that is in the Indian context.

Average perception towards improving enterprise level security is spending more money on it. According to Gartner, organisations spend an average of 5.6 percent of their overall IT budget on IT security and risk manage-

The 2016 Breach Level Index from Gemalto paints a scary picture of what's to come.
