How AMD has Ryzen

We have a quick chat with AMD's David Bennet about Ryzen's share in the market and how the company plans to continue competing.

Mithun Mohandas

mithun@digit.in

There have been quite a few developments around Instinct and Naples. However, we hardly get to hear much about compute related AMD hardware in India. Why is that so?

Whilst compute news has been limited in the past, with the introduction of both Naples and Instinct in 2017, we will see increased communication around this as AMD re-enters the data-center in a big way. Following the success of Ryzen, we are excited to be able to launch Naples in Q2 2017, so stand by for more to be released in the very near future. Server and enterprise markets are other spaces that are starved for competition and the early press and feedback show what we already know – Ryzen was designed with high performance compute in mind and is perfect for enterprise workloads with excellent scalability and performance per watt.

AMD's known for supporting a platform for long periods. AM3+ has been around for more than six years now. How long can we expect the new AM4 to be supported by AMD?

We have stated that our plan for AM4 is to support this platform until 2020. We are committed to long lifetimes for our sockets as seen in the past. This allows for our customers to have multiple upgrades available to them with the launch of subsequent products based on our upcoming architectures.

Spokesperson: David Bennet, Corporate Vice President & General Manager, Commercial & Enterprise Business, AMD

People like choice and not everyone has an unlimited budget. Our goal is to create an ecosystem that allows users to upgrade as little or as often as they want without having to spend as much money as you would with the competition. More performance for less cost.

With Ryzen, our current 7th Generation APUs and upcoming Zen based Raven Ridge APUs all being on the AM4 platform – we believe that the longevity of AM4 is great news for our customers and partners. This stability gives them upgradability for years to come and a platform with all the modern features they need such as M.2, USB Type-C and NVMe to work with for the next four years.

Claiming the lead in CPU performance has always been a cat and mouse game. Intel seems to be

prepping two new Kaby Lake SKUs to compete with certain Ryzen SKUs which begs the question if AMD has anything hidden up their sleeves to one-up Intel? Will we see a Ryzen 7 1900X two months down the line?

Unfortunately, we are not able to speak to future products over and above what we have already announced. That said, we have already indicated that Zen 2 and Zen 3 products are in development and will continue to improve both performance and efficiency along with providing our customers great value in the coming years. The recently launched Ryzen 5 CPUs will help us address a broader part of the market with Ryzen. Long story short, we are ready and still have some surprises up our sleeves.

The Polaris graphics cards went a long way towards increasing AMD's share in the overall GPU market. How big an impact do you think Ryzen will have on AMD's share in the CPU market, both globally and in the Indian sub-continent?

According to the latest market data, AMD Radeon has enjoyed six straight quarters of growth. We believe the opportunity is even greater in the CPU segment. For almost a decade, the high-performance PC market has only had one choice when building a system. We have now brought back real competition to this space and believe this excitement clearly has an opportunity to reinvigorate and excite the market as a whole.

More importantly, AMD believes in open source and providing maximum compute power to maximum people. Just like we did with the Radeon RX 480, we have introduced our Ryzen processors at an incredible price gap versus our competition. We provide better performance than our competition at each price point, and by a considerable amount. I certainly believe this will allow us to capture share from our competition in the Indian sub-continent and around the world. In fact, we are already seeing this happen.
