

Stephen Hawking says leave Earth within 100 years

Astrophysicist Stephen Hawking has warned that humans will need to find a new home outside of planet Earth within 100 years.

Hawking has made a new documentary called 'Expedition New Earth' for BBC's new science series 'Tomorrow's World'. In the documentary, Hawking will highlight how humans will fail to endure climate change, multiple asteroid strikes, overpopulation and epidemics set to happen in the future. As per Hawking, this makes a strong case for humans to start looking for a home beyond Earth.

This is not the first time Hawking has warned us about the end of days on Earth. He's warned us in the past about aliens that might hate meeting us and Artificial Intelligence that could chase us out of our own planet. Lecturing in London last year, Hawking said, "Although the chance of a disaster to planet Earth in a given year may be quite low, it adds up over time, and becomes a near certainty in the next 1,000 or 10,000 years." Now, he feels that it will be imperative to leave Earth before 2117, given tensions between world superpowers, global warming and even genetically engineered viruses.

Weed might help old mice learn new stuff

Experiments have revealed that cannabis use might have a positive effect on the memory of older rodents – but with a catch for younger ones. Conducted by scientists in Germany that have revealed that under the influence of micro-doses of cannabis, older mice might experience a reversal of ageing effects and a revival of learning abilities.

Published online in Nature journal (<http://dgit.in/THCmice>), the study found that cannabis did not have any positive effect on younger mice of the age range of 2 months old, but significantly improved retention and recognition capabilities in middle-aged and older mice of 12–18 months old. On the contrary, in younger mice the effects were adverse, leading to lower concentration periods and lack of attention.

History of frozen food

Today, you can get any kind of frozen vegetables or meat anywhere

in the world. And this is all thanks to one man's ingenious mind, experimenting with some green peas during the 1920s that is responsible for what is now a \$240 billion global industry.

The Evolution of Beauty

Yale University ornithologist Richard Prum, in his new book, 'The

Evolution of Beauty' explains how beauty might have evolved to make us pleasure, not function. It's not about what makes the animals fly better or run faster, it's about what it subjectively enjoys.

What's holding back Artificial Intelligence?

The human brain has capabilities far superior than those of any known objects in the cosmos. But no brain is yet close to understanding how our brains achieve all of these. The enterprise of achieving it artificially or artificial general intelligence (AGI) is not making any progress.
