

Settling all litigation

Apple and Nokia seems to have finally settled their long patent dispute and entered a new licencing agreement. <http://dgit.in/iNokia>

Who really owns Dota?

Federal Judge Charles Breyer lays out a summary of Dota's development history in a recent ruling. Learn more: <http://dgit.in/ownDOTA>

up the bigger AR map overlay. Dhiraj stepped out of the foyer and tapped the side of his head twice to bring up the Epherim dashboard. After the downfall of most major smartphone manufacturers over the last 4-5 years, Epherim had risen from their ashes as a conglomerate comprising of the best software and hardware talent from the world of tech. And their flagship product, the Epherim dashboard, was now used in a multitude of devices – be it in AR, onboard computing or even dedicated terminals. Their own wearables were the most widely used products in the world right now.

Firing up the HexaCab interface took a couple more gestures and swipes on the side of his head. But once it was up, he could see the marker floating in the air to the left of him, indicating that the cab's exact location in real time, as well as the time it would take for it to get to him. If only they had the flying taxis here in Mumbai, that some cities in the world had implemented, all of this waiting would have been immensely cut short.

Four minutes later, the cab pulled into the kerb and the AR marker above

reactions, for most of the city dwelling people like him, it had made life alot easier. For instance, there would be no further communication between him and the driver now unless explicitly initiated – all the details have been sent by Hexacabs once they have verified him using his biometric data. Some experts even said that this was one of the main reasons smartphones lost out – because the world no longer needed a phone to communicate, even for basic stuff like authorisation via OTPs.

The driver himself had a more advanced Epherim lens installed – it was a standard practice with Hexacab drivers. Epherim Neuralink allowed the user to do everything an Epherim Pro could, but completely with thoughts. Something like this was essential for professions like driving, where constant manual tapping and scrolling wouldn't be possible. It was expensive, but the driver wasn't exactly paying for it and the company was saving tons of money with the added efficiency an AR device offered.

As they were picking up pace on the Eastern Express highway, Dhiraj couldn't help but notice the huge mounds to the east. The initial smartphone discarding rate was normal – very few people were willing to experiment with wearable AR devices, even if they were certified by the most reliable authorities in the world. The main concerns were privacy – how could one allow the possibility of constant access to their basic senses, like vision, to a corporation? Gradually, though, people realised that they had already provided access to a large extent via social media and connected IoT devices. On the other hand, concerns were being taken up and tackled head on with corporations by activist groups like Tech2Life. As a consequence, the discarding rate gradually picked up. But the municipalities and the government in general could not keep up – what with everybody

and their grandmother possessing 2-3 smartphones. Huge disposal mounds like these were not uncommon sights in most Indian cities these days. To think, what lay there as garbage right now was the pinnacle of engineering and a symbol of status in its own time. Such was the world of technology. Fickle, and unforgiving.

Today's flagship phones are just destined for the garbage mount as e-waste

Out of the corner of his eye, Dhiraj spotted the time and panicked. He was already running late with the preparations and now he had spent 30% of his journey, as indicated on the floating AR dashboard in the car, wondering about silly philosophical things. It was almost time for the final planning call before the party. Firing up the dashboard again, he brought up the contact list and looked for the birthday group he had created. Initiating a conference video call, he closed his eyelids to let the driver know that he was entering VR mode and didn't want to be disturbed.

The room was abuzz with discussions. It was Aditya's idea to choose the Stark tower as the VR meeting place – made them feel cool, apparently. Dhiraj never got these silly whims. Looking over at Adrija and Sahya, he noticed them showing each other what they would be wearing for the party using the AR module off Dresskart, that allowed to to pick a dress and simply try it on in VR or AR – and that was the end of trial rooms as well. Ranjeet was projecting his latest DotA achievement onto the table to boast about at a couple of other guys. He still

Using augmented reality to tell a person's mood and even health is coming soon

its head turned a bright green before disappearing in a puff of digital smoke. The design choices some of these companies made were pretty interesting. Dhiraj tapped twice again to switch off the AR mode before entering the cab after scanning his finger on the door sensor. While initial implementations of Aadhar had met with some mixed
