

Age of digital medicine

Today, machine learning powers many medical device softwares. And the AI is always learning and improving. <http://digit.in/digitalMeds>

Gear VR vs Daydream

Google's VR platform, Daydream will soon be rolling out to the Samsung Galaxy S8 and S8+ smartphones. <http://digit.in/DayGearVR>

remembered when they had launched their smartphone app, thinking THAT would be what would make them truly omnipresent. "If only one could see the future," he sighed as he tapped the table to get everyone's attention.

"I believe all of us have the details of the party?" Dhiraj asked. There were affirmative nods around the room. "Just in case you don't have them saved yet, here is the invite brochure again," he said, swiping the virtual brochures at each person on the table. "Inside, you'll find the AR map codes to the location, the dress code to filter your wardrobe with, and the menu along with the nutritional information. Keep in mind that you need to specify your dietary preferences at least an hour before the event commences – I would advise checking the reviews and the dish itself on your AR dashboards before deciding. Moving on, I have arranged for Adele to perform via VR at the – hey, c'mon now! You know Raima loves Adele, so no point cringing and making faces about it. Get your own star at your own event. And that's about it for this meeting, see you at the venue". Murmurs rose around the room as people started to trail off. Dhiraj logged out just in time as the car pulled into his house.

Today, the house felt busier than the local OmniMart on a sale day. There were too many family members here for the party. Dhiraj caught the eye of his father from across the room as he entered and indicated him to step aside into the study. Once there, he closed the door behind them, and turned to his father, "I just wanted to go over the arrangements one final time with you, if that's okay?" His father nodded and smiled, looking at his son getting all worked up about his sister's eighteenth birthday.

Dhiraj fired up the map module in AR onto the study table that covered most of the room. The table was enabled with Daego Smartfab, a smart fabric technology that amplified what you could do on normal surfaces in AR. The map hitched onto the four corners of the fabric and the city was

Looks like a fancy set of goggles they put on you when you do an eye test... or is it?

right there in front of them, with a lot of colour-coded pointers moving about at different paces.

"The blue ones are the guests who have responded to the invitation via the RSVP location enabled codes. Almost all of them should be there on time, which means we don't have time to lose. The brown marker is the baker, who has been a pinnacle of incompetence and will probably make it just in time. The big red dot is the decor team which, as you can see, is already at the venue and setting up the decor." At this point, Dhiraj tapped on the venue to bring up live CCTV footage of it being decorated. Tapping once more, he switched the view to the kitchen, "And the prep for the food has also started. Now all we have to ensure is that we get there on time."

His dad looked at him with a fond smile and asked, "All that is fine, but when was the last time you spoke to your sister?"

"Umm...in the morning before I left for office. Is she in her room? I'll go give that buffoon a couple of head

Why build models of anything when computers can do it for you in VR?

bumps before she can officially vote. Why don't you get the guests into the cars while I go get her?", Dhiraj replied as he headed upstairs. As he knocked on the door, some childhood memories in this house flashed before his eyes – without the assistance of a social media feed or an app behind it.

"So you're finally here. I thought you wouldn't make it, what with that stupid office of yours." barked his sister, already impatient and ready to leave for the party, "How do I look?"

She did look pretty. Dhiraj never realised when Raima grew up, with him mostly being away for his education. Now that he was back in the city for his job, he intended to make the most of it, starting with her birthday. His parents surely hadn't left anything out, with the huge budget they had given him to arrange the party on top of what they had gifted Raima – the full Epherim Connected package. She had upgraded to the brain controlled Neuralink lenses and had also received the rest of their wearables and implants like Auralia, the audio implant that could play music directly in your ear, translate languages for you, and even identify lyrics and dialogues to their sources among other things. The devices on her hands and feet would let her monitor her dance classes even more closely, augmenting her learning process with visual guides. Overall, this would be any teenager's dream right now and that's what his sister deserved.

"You look like a toad. Now c'mon! Don't be late for your own party! Let's get going."

As they started heading down the stairs, Dhiraj took one last look at the corridor before switching the light off. This was where he and Raima used to play as kids most of the time, when they had much more time to spend with each other. A time when you didn't have this much to do, all the time, thanks to these constant connections to everyone. A time when you could press the lock button to disconnect everything and be in the moment. Well, that time was all but lost now.
