

Sunrise Smart Pillow

Sleeping is important. We at the test labs know all about how important sleep is, because of all the sleepless nights we spend here. We really treasure our naps. So when something comes around promising to help us sleep better, we pay attention - like the Sunrise Smart Pillow. The creators describe it as an "ultra-comfortable smart pillow" that "wakes you naturally". The smart pillow can "simulate a full sunrise". Because that's apparently how our bodies are

most comfortable waking up according to science. The gradually increasing light actually tells your body to stop producing Melatonin, which is the stuff that makes you sleepy in the first place. So now you can have the sunrise whenever you want it to. Sweet. But we all know that's not enough. "So you turned the lights on, that won't wake me up!" The smart pillow then proceeds to play sounds which you've set up on it, gradually increasing the volume till you're wide awake. The Sunrise smart pillow is tracking your sleep, it knows when you fall asleep and knows when to start the waking-up process. It even rates your sleep. We'd all probably fail... But yea, we're talking about the smart pillow here. There's a whole lot more this pillow can do and it's definitely worth checking out. We know for sure that we'd love to test it out...for a long time!

SHOWCASE

CaptoGlove

CaptoGlove is a wearable controller. It's basically a glove, a wireless glove, with which you can play your games. We've been obsessed with glove-like controllers since the Power Glove was announced way back in the early 90s. Unfortunately, the Power Glove was quite a letdown. CaptoGlove aims to fix that by bringing you a true blue wearable glove controller. CaptoGlove lets you control your games with simple hand gestures. The creators claim it'll work with all PC games - past, present, or future. There's a large selection of gestures you can use with your CaptoGlove (your hands are capable of many gestures, duh!), so you can replace your keyboard, mouse, and peripherals entirely. You can set up your own custom profiles and gestures or download a pre-set configuration of profiles that are ready to go. You even have the option to use two gloves or one

and also to use both in sync, mapping different controls to different hands. As an added bonus they're also VR ready and compatible with all popular VR headsets in the market right now. It's even compatible with mobile devices, so it'll work with your Android and iOS devices as well. Here it can be used for more than just gaming and even be used to initiate calls and other actions. CaptoGlove connects to devices via Bluetooth 4.0 and provides 10 hours of gaming on a single use. It can be charged via a microUSB port. Definitely a 'handy' peripheral to have around.

Planar Elliptical Runner

Most robots today are still in the early stages of advanced robotics. They haven't learnt to do much, especially in the locomotion department. There are a few exceptions here and there, like the Boston Dynamics' Handle, but for the most part, they're still learning to walk and are stumbling around - so, not really stuff nightmares are made of. However, the Institute for Human and Machine Cognition in Pensacola, Florida, has come

up with a robot that runs. What's unique about this little runner is that it doesn't use sensors or computers to help balance itself. It's mechanically designed in a way that gives it stability. Depending just on the mechanical design for stability gives it a more reliable build, with respect to locomotion. The design makes it look kind of like an ostrich though, or a T-Rex of old. Though not as big of course. If that wasn't enough of a hint, the way it runs is also similar to animals that run on two legs. The Planar Elliptical Runner has a single motor that drives its legs and it's capable of running at speeds of 16 kmph. The researchers behind it have also stated that it'll be able to reach speeds of 30 - 50 kmph if it were the size of a human. Although that sounds pretty exciting, this is definitely not something you want to see running at you out of nowhere.
