

Bragi Dash Pro

German startup Bragi first made its mark on the world when they announced their first totally wireless earphones, The Dash. Their Kickstarter campaign made a whopping \$3.39 million, but it wasn't quite able to deliver on every feature they promised. They aim to fix that with their new Dash Pro. They've revamped it and are calling it the "world's first custom-made wireless ear computer". The Dash Pro is also designed to work with the iTranslate app for real-time language translations in face-

to-face conversations. The Dash Pro contains 150 microcomponents, a 32-bit processor and an AI dubbed the Dash AI. Bragi has worked on the design of the Dash Pro to make it fit better in your ears and have also worked on improving the earphone connectivity. These earphones have 4GB of internal storage on them to store your music or audiobooks and they last about 5 hours on a single charge. Oh, it's also completely waterproof, so you can go swimming while wearing them and the sensors can even track your movements. It's not limited to swimming, the sensors can even track running and cycling as well.

CowaRobot R1

Frequent travellers know the woe of having to constantly lug their baggage around. You have to drag or carry it around with you and then once you set it down you need to constantly have an eye on it so that it doesn't get swiped. Well, you don't need to worry about all that with this smart case. The CowaRobot R1 is a robotic smart suitcase that follows you around. All you need is a bracelet so that it can track you. It can keep pace with you at speeds up to 7 kmph, which is more than enough considering the human average walking speed is just around 4 kmph. It has inbuilt sensors called CO-EYE which basically help it detect cliffs or stairs or stuff it might otherwise fall off of. You can switch the suitcase to manual mode by simply grabbing hold of the handle. It vibrates when it detects that you're getting too far away from it and you can double tap the bracelet to have it automatically plan a path back to you. It's also got a mobile app to help track it if it gets misplaced or stolen. The app also monitors battery levels of the case and its lock system. Only the person wearing the bracelet can open the case.

RetroN 1 HD

There seems to be a retro craze of sorts going on right now. It's no surprise the people gobbled up the NES Classic when it hit stores some time ago. So much so that it ran out of stock and as of April, it's also been discontinued; which a lot of people are quite disappointed about. But fear not! There are alternatives, like Hyperkin's RetroN 1 HD for example. Not only is this thing cheaper than the NES Classic, it's capable of playing all the NES games. All of them. The NES Classic allowed you to play only a few of the classic games for some reason. The RetroN 1 HD fixes that. Also

you can play games at 720p and switch between 16:9 and 4:3 ratios. So you can plug it into your old school CRT TVs as well as your monitors via HDMI. The accompanying controller also has a 10-inch cable as compared to the NES

Classic's 3-inch controller. The only drawback seems to be that it doesn't come with games of its own so you'll have to scour the online markets for them.
