

ClickPack Pro

The ClickPack Pro is a backpack designed to improve your travelling experience. In the words of Korin Design, the folks behind the ClickPack, it's an "anti-theft backpack which combines security, storage, convenience, comfort and beauty". ClickPack comes with a retractable metal wire lock which can bear weights of up to 50kg. You can fasten the bag to wherever you're sitting for extra security. This is in addition to the zipper locking mechanism on the bag itself; the zipper has a double coil chain to prevent it from being easily punctured or damaged. The backpack uses a slash resistant fabric that's composed of 60 percent polymer polyethylene fabric, 30 percent industrial-level polyester silk and 10 percent military grade glass fibre. It's water resistant and comes with its own rain cover. It can even charge your electronic devices. The backpack was designed keeping comfort in mind and to put as little stress on the back as possible. Talk about a jack of all trades right there on your back.

Assolar SS-12

The Assolar SS-12 is a slingshot. Wait wait, it's not the sort you're thinking about, it's a really badass slingshot. It's got a spring-loaded mechanism which will let you fire projectiles at speeds you wouldn't think was possible for a slingshot. It's even equipped with an infrared laser so that you don't miss your target, though at the end of the day you still need to know how to use a slingshot to actually hit anything. As for the projectiles, you can use good old rocks, or small steel slugs or whatever else slingshots normally use as ammunition. But if that wasn't enough, it can be converted into a mini crossbow of sorts which can fire mini arrows. So if you suck at slingshotting, you can just fire at your target, which we hope is not alive. Keep in mind, this isn't a toy, it's a legit hunting slingshot. Handle with care.

Ultrasonic Clothes Dryer

Wouldn't you love to have an ultrasonic clothes dryer, even without knowing what it actually does, only because it sounds cool? We would. But here's what it does. The Ultrasonic clothes dryer has been designed with one goal in mind – to save energy without compromising on drying time. It aims to make drying clothes more efficient by parting from conventional

heat-based drying methods. It instead uses piezoelectric transducers to dry your clothes using vibrations! The high-frequency vibration atomises the water out of the fabric. It literally extracts moisture from your clothes in the form of a cold mist. One round of drying is expected to take only 20 minutes. According to researchers, this method of drying is better for the clothes as well, enabling them to maintain their grade and quality for longer. It'll also reduce issues with lint in the air processing system. Talk about revolutionising the dryer industry.

Current

Current is a startup which lets you control debit cards through an app. It's designed primarily for kids to use and to help parents monitor their usage. Its main goal is to teach kids money management while simultaneously allowing parents to keep an eye on them and ensuring they're not spending on the wrong things. The app also lets both parents and kids track their expenditure. The Current app has some other neat features built into it. For example, parents can assign chores to their kids through the app and offer rewards for completion.
