

Lechal Smart Navigation and Fitness Tracking Insoles

Fed up of getting the wrong directions each time you ask for help? Here's a cooler alternative. Lechal is a smart navigation system for all your footwear.

The system consists of two pods that can either be slid into insoles or they can be slipped into your laces with the help of a sleek looking buckle. The two pods are quite compact and

consist of Bluetooth modules paired with batteries and biased motors for feedback. You can set the intensity of the vibrations and the batteries last quite long. The navigation part is a teensy bit off, especially when we tried it out in Mumbai, but the data collection seems to match that of Google Fit. We're eager to try it out in more locations but overall, these are pretty nifty.

LetsTrack GPS Tracker

Whether you're paranoid or just plain cautious, a GPS tracker is a pretty good investment when it comes to keeping a track of where your priceless vehicle, aged relative, or progeny are at any given moment. LetsTrack joins the much crowded GPS tracker market which has seen a huge spurt since radio cabs took off in the country.

The LetsTrack Prima, which we tried out, has the added functionality of engine cut off. Given the fact that the robbers are going to search for tracking devices soon after stealing your prized Maruti, you're better off acting quick before traffic becomes a risk. The included app is pretty simple to use but the tacky UI can be quite the eyesore, but how often do you lose your loved ones or possessions?

Kodak ScanMate i1150WN

If you've only used the scanners built into multi-function printers then enterprise scanners like the Kodak ScanMate i1150WN are great fun. By fun, we mean to indicate how fast it can go through documents. The scans come out at 600 DPI which is just brilliant for those who work in the print industry. Setting the ScanMate i1150WN is a pretty easy affair and it comes with a bevy of additional software bundled. The irksome part is that you have to set the unit up with a machine in order to start using it. For ₹46K, we'd

have preferred if the ScanMate i1150WN came with a USB or MicroSD slot as well.

One of the neat features is OCR which is present in almost every scanner, but everyday MFDs take ages to go through

a bunch of papers while the ScanMate i1150WN just zips through them. It takes a little over a second per sheet of paper with OCR on. Without OCR and with fewer than 11 pages, Kodak has something called transaction mode which speeds up scanning to a rate of 40 pages per minute. That's a very wise use of the built-in cache memory that the competitors can learn from. The unit has nine different scanning profiles, which does seem fine, but we'd have preferred if it would allow custom profiles to be created.
