

Bringing Cortana to life!

If you've wondered what Cortana would look like, you can thank a Halo fan. A developer named Jarem Archer has created a concept Cortana Holographic device that brings Windows 10's native Cortana experience to life. In a video he made, you can see the hologram walking, talking and displaying weather information, and it's impressive!

The device itself runs on 4GB of RAM and has a built-in Arduino board to control the platform lights. gave shape to the Cortana hologram using a Pepper's Ghost hologram. A portable USB monitor on the top reflects on the three panes of mirror glass placed inside

a custom-made enclosure. The entire machine, each part of the assembly, was 3D printed in PLA.

AI solves police cases

Watch out Sherlock Holmes and Hercule Poirot. There's a new detective in town, and it's not even human! UK Police is trying out a system where police data is being used by a computer to analyse and propose a solution for how a particular crime was conducted.

The system, called VALCRI, is intended to replace a crime analyst so that the tedious part of their job is done easily and quickly. This will allow the analysts to focus on the more important parts of their job, which is the case itself. Additionally, this system can ensure that a possibility or a theory hadn't been missed or omitted

by human analysts because it explores all possible outcomes. Brute-forcing a case? That's new, eh?

HP audio drivers have keyloggers!

HP is back in the limelight for the wrong reasons. We thought HP was done with anti-customer moves for the year when they were caught blocking third-party cartridges via a firmware upgrade. However, this time they've really gone too far. If the security firm *modzero* is to be believed, a certain audio driver package for HP laptops has a hidden keylogger! If you have an HP laptop that uses the Conexant Audio driver, everything you have typed on your keyboard has probably been recorded. Of course the logged keystrokes are not being transmitted anywhere, because this is the result of poorly coded and configured software.

Many software make use of hotkeys when they're running. Usually you create a listening event to catch a certain hotkey. However, within the Conexant Audio driver, HP introduced a number of debugging and diagnostic features which caused not just the predetermined hotkeys, but every single keystroke to be recorded and logged to a file on the system. This essentially, makes it a keylogger!

One app to rule them all

For some users, Facebook, Messenger and Instagram are

showing mixed notifications across the apps. The Facebook family of apps are among the most popular apps across both iOS and Android, and this development may mean them coming even closer together.

Unmanned fighter jets

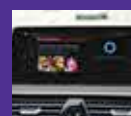

The US Air Force Research Laboratories and Lockheed Martin

demonstrated a mixed formation of manned and unmanned robotic F-16s in a simulated combat environment, showing how an unmanned combat air vehicle can react and adapt to unforeseen obstacles while performing missions.

Microsoft's Connected Vehicle Platform

Microsoft is not exactly new to the field of automobiles.

The company has been working on technology to connect automobiles over cloud platforms, share information and create a web of vehicles that will be mutually aware of each other.
