

Insta360 Air

The Insta360 Air is an Android smartphone camera clip-on that lets you turn your smartphone into a 360 degree VR camera. The Insta360 lets you capture images in HD at 360 degrees. It's also got a 'VR' mode which allows you to connect a headset and experience content in VR. One of the perks it's got going in its favour is its size and portability. Attaching it to your smartphone is quite simple with a USB connector. The Insta360 Air features a 210 degree dual fish-eye lens and real-time image stitching. It doubles as a 360 degree webcam for your laptops or other devices as well, making it a viable option for video calls and even livestreams. Once you've installed the app on your smartphone, it

automatically activates when you connect the Insta360 to it. The app has a selection of 'modes' for you to choose from for the kind of media capturing you want to do. You can find this clip-on camera on Indiegogo or on Insta360's website.

TriLens

If you've seen a professional grade camera then you know that's some bulky stuff. The camera, the stands, the lights, the lenses – it's a lot to carry around. Imagine how much it must suck if you forgot something or the other in the heat of the moment or ended up carrying the wrong lenses. Other times, you might have the 'moment' right in front of you but you're fiddling around with the bags to get the right lens out - ending up missing the shot. Frie Designs have come up with a solution for these problems and they call it TriLens. TriLens lets you safely carry

up to three extra lenses, and helps you keep track of those sneaky lens caps that keep disappearing. The body is made of high strength steel and fiber reinforced nylon and it can handle loads up to 100kg, so you don't have to worry about your heavy duty lenses being at risk. Now you have the freedom to experiment while on location thanks to the TriLens. The handy accessory starts from \$75 and comes with a three year warranty. The maximum lens diameter supported by TriLens is 92 MM and is compatible with most popular lens makes. Look TriLens up on Kickstarter.

Jelly

Why would someone want to crowdfund Jelly? Actually someone might. The Jelly we're talking about is a smartphone. In the words of its creator, Jelly is "The Smallest 4G Smartphone." When they said small, they weren't kidding. This

thing is tiny. It's small enough to fit into the coin pocket in your jeans. Jelly comes with 1GB RAM and 8GB Storage, but there's also a Jelly Pro variant with 2GB RAM and 16GB storage. It can hold two nano SIMs and even has dual cameras. It comes with Android Nougat and should be able to run most apps just fine too. That's a powerful tiny phone right there. Find Jelly on Kickstarter.

Woogie

Woogie is learning assistant for toddlers. This cute little AI bot can engage your kids in conversation, and sate their curiosity, as it's loaded with jokes, riddles and more.

But it's more than just that, it's compatible with smart homes and has a safety light and alarm clock. Woogie comes with its own mobile app for parents. Here parents can choose the kind of topics they want Woogie to engage the kids with. You can find Woogie on Indiegogo.
