

Ashes of Creation

Ashes of Creation had already hit the \$2 million mark as of writing this bit, which was well over the asking amount. But it was still live, so you can still go and back the game, and maybe get some exclusive backer-only goodies when it does go live. As with all games that get overfunded on Kickstarter, it's doomed with the gamer community's high expectations. We hope they can live up to it. On to the game itself, Ashes of Creation is an MMORPG by Intrepid Studios,

which is aiming to create a factionless, high-fantasy online game. They also want to keep the P2W (Pay 2 Win) factor completely out of the game. You can build up cities and destroy them, in the words of the devs "all of civilization is the responsibility of our players". The world will be alive and constantly shaped by players. It will be interesting to see how the game is and where it goes - once it's out, that is.

Evapolar 2

Some of us really can't survive the summers without ACs. For those of you who have never experienced summer in India and have no idea what we're talking about, lucky you. Evapolar is a device a lot of us would really REALLY want for the summers. It's basically a personal AC. It cools, humidifies and cleans the air around you, while doubling as an air filter too. Evapolar lets you adjust it according to your needs. You can adjust the temperature and the humidity levels, effectively creating your own microclimate. In addition to cooling the air around it, humidifying and purifying, Evapolar is also portable and is compatible with smart home hubs as well. So it'll work with Google Home, Amazon Alexa, etc. The creators claim it's eco friendly as well, since it uses water to cool the air, and not a chemical freon-based coolant like regular ACs. This thing ships worldwide, so if you're considering getting yourself a personal AC, check Evapolar 2 out on Indiegogo.

ERGO

ERGO is a device that helps you support and strengthen your posture. A lot of us have desk jobs these days because of which our postures have gone to the dogs. We just slouch in front of screens all day. ERGO aims to fix that by holding your body in the right spinal alignment and preventing you from slouching. It does this by supporting your mid-back vertebrae. The guys behind ERGO claim that wearing it for just 1 - 6 hours a day is enough to help you improve and strengthen your posture. And if you can power through the entire day while wearing it, it'll even help you relieve your neck, back and shoulder pain. ERGO is pretty simple to put on, just like you would for any backpack. There's no restrictions when it comes to size as well. It also doubles as an exercise device of sorts; for you to get a few rounds in during your off time. You can find the crowdfunding campaign for ERGO on Indiegogo.

NSG SO

NSG SO claims to be the world's first fanless chassis. There's a lot about the NSG SO that makes it stand out from other PC cabinets out there. There are no moving parts - meaning no fans, no pumps, no water, nothing. Hence your PC will run (or rather prow!) as silently as a cat. The design might remind you of the Thermaltake Core P5 and P7, cabinets. The cabinet is built with modders in mind so there's a lot of customisations you can do. The NSG SO keeps your CPU and GPU cool with the help of Loop Heat Pipes which direct the heat to the back of the body. They also include mini-heatsinks to keep the VRMs (voltage regulator modules) cool. You can check the NSG SO fanless cabinet out on Kickstarter.
