

Vaio Z Mercedes-Benz

Vaio is launching a new Mercedes-Benz special edition Vaio Z laptop that makes a car sound when it boots up. <http://dgit.in/VaioZbenz>

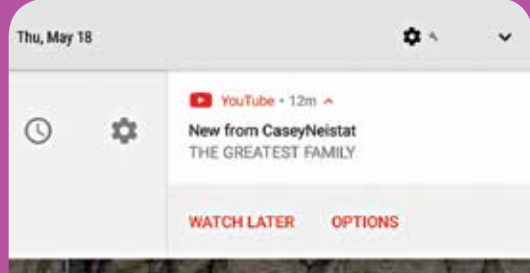

Sony cancels a segment

Sony is planning to stop making smartphones in 'Premium Standard' segment which includes phones like Xperia X. <http://dgit.in/XperiaXrip>

05 SNOOZE NOTIFICATIONS

There were minor tweaks made to the notification window in terms of animations and functions. For instance, you can now look at the battery percentage with a single down swipe rather than two swipes in Nougat. The Edit and Settings icon have also been moved to the bottom of the notification window. The useful update here is the snooze button that comes up if you swipe a notification to the right. You can tap on the snooze button and make the notification disappear and reappear after an interval of either 15 or 30 minutes or 1 hour. This feature takes care of the uneasiness some users feel with an unread notification looking straight into their souls, dying to be opened. Once the set interval ends, the notification will reappear and if you wish, you can snooze it again. This would be really helpful if you follow certain YouTubers, but don't really want to get caught goofing around on YouTube at work. With this, you can just snooze their latest update for a later time and when that time comes by, get that notification again. Say goodbye to FOMO with this one.

06 USE APPS IN PICTURE-IN-PICTURE MODE

Another awaited feature in stock Android, PIP mode lets you use two apps simultaneously. We say stock Android because this feature could be enabled in way older versions of Android. This was possible by an Xposed module called XHaloFloatingWindow. Although multi-window also lets you use two apps simultaneously, the advantage of PIP mode is the flexibility to move the window anywhere on your screen while using another app in the background. Usually enabled by default as soon as you upgrade to Android O, many users including us weren't able to use PIP mode. The workaround is to head over to Settings > System > System UI Tuner > Navigation bar. Here you need to add an extra button on the bottom navigation and to do that tap on "Extra left button type" or "Extra right button type". If you want to enter the extra button on the left then tap on Extra left button type > Keycode > Left keycode and enter 171. You can also add an icon with Left icon so that the tap area is visible. Now, open YouTube or Duo (the apps where PIP work for now) and tap on the newly created left icon. This action should take you to the PIP mode. We expect to see other apps supporting PIP mode soon.
