Apple is testing 5G

Seeking experimental licence to test next-generation wireless technology based on millimeter wave. <http://dgit.in/5Giphone>

07 ENJOY AN IMPROVED COPY/PASTE EXPERIENCE

There must have been times where you've copied the name of a location and pasted in Maps while searching for a place. There also must have been times when you copied an email address over to your email app before sending out your email. Google is making it easier by recognising the text selection and serving you the relevant app. They are calling it "Smart Text Selection" and it works by implementing machine learning on the device itself. This feature makes it possible to recognise addresses, locations, telephone numbers and email addresses, simply by selecting

them. Upon selection, along with the standard 'Cut, Copy, Paste' options that you get, you are also given the option to open a relevant app, with respect to the selected text, with the selection as an input parameter. Google says they are also working on recognising URLs and for now, it requires an http or https prefix. Maybe later they will be able to recognise domains such as .com or .in and accordingly fetch the default browser as well. In short, Google has taken it up as a personal responsibility to make Android users as lazy as possible – one feature at a time.

08 ADDING EXTRA BUTTONS ON THE NAVIGATION BAR

The System UI Tuner lets you customise several areas including the status bar, navigation bar and lockscreen. Before that, you need to enable System UI Tuner by pulling down the status bar and pressing the settings icon for a few seconds. Then head over to Settings > System > System UI Tuner. The status bar lets you enable or disable the icons that are visible on top including Bluetooth, Wi-Fi, Mobile Data, Airplane Mode, etc. The lockscreen setting will let you change the two default icons seen on the bottom of your lockscreen and switch them with any app.

The navigation bar setting lets you add an extra button on the left and right of the default three navigation buttons on the bottom, making it a total of five buttons on the navigation bar. The buttons can either be a Clipboard or the Keyboard Switcher or you can manually enter Keycodes. Keycodes are values assigned to carry out a specific action or event. There are hundreds of keycodes and browsing through all of them can be overwhelming. You can check all of them out here <http://dgit.in/AndKeycode> and select the ones that you want as the extra buttons.

09 REVERTING BACK TO NOUGAT

Let's accept the fact that being a beta version, it will have its own set of bugs and crashes. It won't be much of an issue for power users because they are used to it anyways. If the bugs start getting on your nerves, then you can go back to the stable Nougat build easily. In order to leave the beta program, all you need to do is head over to the Android Beta program portal (link mentioned above), click on "Unenroll your device" and then select "Leave beta". Shortly, you will receive an OTA update that will take you

back to the stable Android 7.1.2 Nougat build. Do note, installing this OTA update will wipe your phone data.

If you had installed the beta from the factory image manually, the process is the same as installing the beta factory image. You need to search and download the correct stable Nougat factory image for your device from <http://dgit.in/AndFactImg>. After downloading, you have to follow the same instructions mentioned in step 3 to finally roll back to Nougat.
