CAREERS

There has been an awakening in cyber security

incidents in West Bengal. So even if the numbers might vary a bit, they're no less significant.

In fact, the demand for cybersecurity professionals is outpacing the supply of qualified workers. According to NASSCOM, as of 2015 we had about 50,000 cyber security professionals in India. That number hasn't gone up much since and we will require one million cyber security professionals by 2020 to meet the demand. Currently, India's cyber security faces a shortfall of 4.7 lakh experts. So, in case you were wondering if cybersecurity has lost its sheen as a career choice, put those thoughts aside in a box (preferably locked securely) and read on.

THE SKILLS

It is not particularly easy to spot particular skills in cyber-security to focus on. This is because of the evolving nature of threats and how the overall focus changes with each big attack. What can be focussed on, though, is the broad approach that works. Kaspersky Lab's recent research into

the most important characteristics for working in IT security as being able to think out of the box (44 per cent) and work away from normal environments (39 per cent) and formal structures (38 per cent). A third (35 per cent) also agree that it's important to be naturally curious about how things work.

WTF

Contrary to what popular depictions you believe, there is one skill that you don't need for a career in cybersecurity – mad typing skills. We're going to say this once and for all – nobody needs to type particularly fast to stop a hacker – or to hack for that matter.

Along with that, target areas within cybersecurity that are going to be in the crosshairs of security firms in the near future are intrusion detection, secure software development and attack mitigation. But as Rajpreet Kaur,

Sr. Research Analyst, Gartner, puts it, almost everything under the broad umbrella of cybersecurity needs to be explored. She explains that broadly, the key areas one should keep an eye on are "cloud security, data centre security, network security, endpoint security along with security operations and monitoring."

THE QUALIFICATIONS

To start off, you will need a graduation degree in computer science or information technology, although you could be from another stream of engineering and undertake certain short term courses to gain basic computer skills. Post that, you would need to appear for certain certification exams and undergo further courses to build your repertoire in cyber security. According to Rajpreet, it is generally a good idea to start off with some basic security certifications like Cisco Certified Network Administrator (CCNA), before moving on to more specialised certifications that ramp up the eligibility of a candidate for roles with higher demand. For instance, Certified Ethical Hacker, a certification offered by the US-based EC-Council, establishes your credibility as a skilled security professional who understands and knows how to look for weaknesses and vulnerabilities in target systems by using the same knowledge and tools as a malicious hacker. Some other useful certifications that are relevant currently are:

- **Certified Information Systems Security Professional (CISSP):** Offered by the International Information Systems Security Certification Consortium, CISSP credential
