

### Moto G5S Plus leaks

New leak reveals metal unibody design and an interesting dual-rear camera setup. <http://dgit.in/MotoG5Splus>

### Juno's latest findings

Performing the closest approach to Jupiter ever, strong magnetic field and massive polar storms were found. <http://dgit.in/JunoNew>

## Certified Information Systems Security Professional

One of the many certifications relevant right now

holders are mainly decision-makers who can develop, guide and then manage security standards, policies and relevant procedures within their organisations.

- **Certified Information Security Manager (CISM):** Introduced by the Information Systems Audit and Control Association (ISACA), the CISM credential targets the needs of IT security professionals with enterprise-level security management responsibilities.

- **Certified Information Systems Auditor (CISA):** This certification is mainly focussed on the skills and knowledge required to effectively audit information security environments, identify vulnerabilities and meet security challenges of a data-first enterprise.

On top of these, there is one irreplaceable factor that is important to get your dream information security job – an information security job.

You heard us right, although it might sound recursive at first glance. What we mean to say is, there is nothing as important in the world of cybersecurity as experience in handling threats.

So if you are getting a relevant job offer – even from a smaller company than you would prefer – go for it to gain hands on experience that will prove to be invaluable when you are applying for your dream cybersecurity job.

### THE OFFER

Salaries in the world of information security depend largely on what you bring to the table. For instance, according to Glassdoor, the salary of a security analyst can vary anywhere between ₹3.5lpa to ₹10lpa approx. That range comes from the factors we discussed in the last section – relevant certifications and experience.

If you're confused about the companies to work for, you need to understand the cybersecurity market situation a bit more. In the last few years (about 4-5) a trend of outsourcing security to Managed Security Service Providers (MSSPs) had increased greatly, according to Gartner. Corporations have spent huge sums of money to take a black-box approach to security, where the outsourced firm takes care of everything. But of late, with the market evolving due to

recent wide-scale threats, the same MSSPs are being asked for value in the services they are offering. As a result, a lot of IT companies, or companies with an IT department, are looking at setting up internal security teams to keep the security profile in-house. This would mean additional investment, that eventually pays off in the form of complete awareness about the security decisions being taken for the company.

“Skill development in building a security team is preferred as it is more effective.” says Mohit Puri, pre-sales head, Sophos India & SAARC, “We also emphasise on security research since it is often used synonymously with hacking. The general perception concerning hacking among most people in India is pessimistic – often hacking is conceived as an unlawful activity. On the contrary, security researchers help in discovering diverse security vulnerabilities faced by several private and government sector organisations, which goes unsung on most occasions.”

### CATCHING UP

That's the name of the game in a career in information security. No amount of pre-existing knowledge and certifications can assure you a long and sustainable career in this area since threats are evolving as we speak. A good practice would be to actively follow eminent security journals and conferences like the IEEE Security and Privacy (<http://dgit.in/IEEEsnP>) and Black Hat (<http://dgit.in/BlckHat>).

New threat areas such as IoT and wearables barely have any security standardisation and as a result, are going to be highly in-demand when it comes to security. And by the time we get there, we will have even more advanced and diverse areas to take care of. So, if you're in this for good, along with everything mentioned above, you will need a constant desire to learn and stay on top of the latest threat landscape. With that one last ingredient in the mix, you're good to go on the way to become our digital saviour. 

More organisations are opting to build in-house security teams
