

Twitter's new emojis

Twitter added 239 new emojis however all of them may not be readily viewable outside the official website and app. <http://dgit.in/twimojis>

Blippar's car-identifying app

Blippar's new car-identifying app can recognise any car made after the year 2000 with the help of machine learning <http://dgit.in/BlipCar>

This becomes our base model for customization, and is the exact shape and size for an iPhone 6 cover.

STEP 3

CUSTOMISATION

You can customise a phone cover in a variety of ways, say by adding some text like your name or add graphics

One of the ways to customise it is to introduce a pattern that repeats in the design

like your company's logo or even add in a pattern that you like.

There are various paid software which make this process easy and convenient, but we are going to use a software that is professional and yet has some tools available free of cost to cater to beginners.

The software is called Meshmixer and can be downloaded from www.meshmixer.com

Once you have the design, you will also need a data preparation software

If you want to add a premade logo or design, all you need is a vector file

to prepare the file for a 3D printer. For this purpose, download the free, trial version of Autodesk NetFabb.

Customisation 1 - Personalized message.

- Head to Tinkercad by Autodesk

- and start the online free software.
- Click on Import and import downloaded iPhone cover .stl file. Rotate it to get the back on top, as shown.
- Select TEXT from top right drop down list, as shown below.
- Select the alphabets and drag drop them on the back of the cover. Place them as you want it on the actual cover. Make sure that the

You can also use standard objects available in Tinkercad to add letters and likewise

- placement of the text is exactly on top of the flat surface of the cover as shown.
- Once you're designing is complete, click on EXPORT and export .stl file of your customised design.
- Or you can create a .svg file of your logo by using 2D softwares like photoshop. Import this SVG file and adjust the dimension. Place this on the back of your phone cover to give it an embossed look.
- Now open the exported .stl file

The build underway in a Flashforge 3D printer

- in Autodesk Netfabb for fixing the file and making it ready for printing.
- Then click on Fixing tool and fix the file using automatic repair.
- Now right click on the part and export as .stl to save the file.

- Send it to printer to get your 3D printed iPhone 6 phone cover.

Design 2 - Patterned cover

- Lets import the downloaded .stl phone cover file into Meshmixer software. Click on View > Show Wire-frame
- Select the object by pressing [CTRL] + [A] then click on select >edit>remesh.
- Adjust the dimensions until the size of the triangles shown corresponds to the desired pattern size. Then click on Edit > Make Pattern.
- Select Dual Edges in pattern type as shown in image below.
- Now you have a cool looking iPhone cover with a custom pattern. Click Apply to accept this design.
- Click on File > Export to save this design to .stl format and print it on a 3D printer.
- Open the pattern file in Autodesk Netfabb.
- Now click on and fix the file as explained in Customization 1.
- Right click on the part and export as .stl file.
- Part is ready for print.

NOTES

Customization 1 - Personalized message.

This design can be easily printed on desktop 3D printers (FDM technology). This design will take about 1.5 hrs to be build at medium quality. The accuracy and finish of FDM 3D printed parts will be of medium quality with the 3D printers readily accessible in India as of now.

Design 2 - Patterns

This design is complex for (FDM) desktop printers as the support structures involved may prove to be a problem while cleaning up the 3D printed part. Selective laser Sintering (SLS) 3D printing technology would do justice to this design. SLS 3D printed part have a superior finish and more accuracy than what FDM 3D printers can attain.
