

Hacking a pacemaker possible

A recent study finds security weaknesses on pacemakers that make it possible for the devices to be stopped. <http://digit.in/HackPace>

BA cancels flights again

British Airways cancels all flights at London Heathrow and Gatwick airports following another major IT failure. <http://digit.in/BAfailIT>

DISPLAY

Samsung Galaxy S8

The two univisium displays in this comparison suffer from pillarboxing issues, meaning content will appear with black lines on the top and bottom, or either sides.

Samsung offers a button to stretch videos, but that doesn't always do a very good job of fitting videos to the screen. Samsung's AMOLED panels come with toned down colour saturation, meaning the trademark yellow hues of the panel are reduced. Combined with the best contrast ratio in this comparison, Samsung's display could easily be considered the best amongst these three smartphones.

LG G6

On the other hand, LG's display is more focused on balancing all colours, than making them pop. There's an IPS panel here, which produces considerably lower black levels and

contrast ratio. However, it's a good looking display, still.

Luminance levels are 702 Lux, which is pretty much in the ballpark of what we see here. In comparison, the Xperia XZs produced luminance ratings of 705 Lux, and the Galaxy S8 is the brightest, at 775 Lux.

In terms of touch response and brightness, LG's display is impressive, but better black levels would ideally have been more pleasant to look at.

Sony Xperia XZs

Sony's used its Triluminos technology, and unlike the other two this display produces cooler colour tones. Of course, that doesn't mean this display is poor in any way. 1080p on a

5.2 inch panel is good enough and though pixel densities aren't as high as the other two, 424 ppi is more than enough. Sony's display looks impressive and produces vibrant colours and deep blacks. The difference here is contrast levels. While the Xperia XZs produces good colours and black levels, Samsung's AMOLED panel still pulls ahead here. Our primary concern about the Xperia XZs are a slight colour shift from angles, and a noticeable drop in brightness.

CAMERA

Samsung Galaxy S8

There's a newer sensor on the Galaxy S8, but the camera still tends to oversaturate and loses details at times. Images are pleasant to look at, but colours like grey or white

appear slightly yellowish. Also, the camera seems to oversharpen images at times.

That said, Samsung is miles ahead of both other phones in this comparison when it comes to low light shots. Though there's detail loss here, brighter images more than make up for it, with very little noise to speak of. Low light shots is where Samsung pulls ahead of almost every smartphone out there today, barring only the Pixel.

LG G6

Much like its display, LG's focus here is in attaining balanced and natural photos, which is what a camera should be about. Like the other two camera, dynamic range is

impressive here, but what strikes us more are the balanced results on images.

Pictures look natural, with no colour looking out of place or oversaturated. White balance is very good, while images are also sharp and detailed. LG actually produces better details than Samsung here. In fact, if it wasn't for the impressive Galaxy S8 and Pixel phones, this would have been considered good even.

Sony Xperia XZs

The Xperia XZs 19MP camera is much faster than we're used to from the Japanese giant. Booting and processing is much faster. Combined with good image quality,

we finally have a flagship Sony camera that can stand up against Samsung and LG's cameras.

Like LG, the Xperia XZs camera also produces impressively balanced colours, with good white balance. Images have good details to boot. However, Sony fails miserably in low light, when compared to the other two contenders. 960fps videos is not something many would need. Moreover, these can't be used in low light
