

### Tabby's star is dimming

Known as the KIC 8462852 or nicknamed Tabby's star, the distant star in the Cygnus constellation is dimming again. <http://digit.in/KICtabby>

### Apple hits \$800 Billion

Apple's market capitalisation hits \$800 billion, with 33% gain and inching closer to become first \$1 trillion company <http://digit.in/800apple>

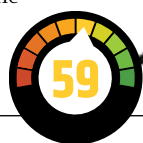

## SteelSeries Rival 500

### Feel every headshot on your palm

**W**hen picking a gaming mouse for MMO/MOBA games, sensor accuracy doesn't find itself high up in the priority list. The most sought qualities for this genre are features, size and the grip style. The Rival 500 bundles a number of features beneficial for MOBA gamers, that can also be taken advantage of by FPS gamers. The PMW3366 sensor isn't as good as the PMW3310 found on Zowie mice and the SteelSeries Rival 300, but it's sufficiently accurate for serious FPS gaming if not for competitive gaming. There's no acceleration or deceleration issues with the sensor, but on higher CPI levels, we noticed angle

snapping slightly. The weight is a bit of an issue though. The Rival 500 is well built with a matte coating on most of the outer body and rubberised zones on the left and right side. The buttons on the left side have been placed in such a way that they don't interfere with your thumb while holding the mouse. The most interesting feature we loved on this mouse is the tactile feedback

engine. Although not a first, essentially the mouse vibrates based on different events in-game such as health status, headshots and low ammo. Tactile alerts can be edited from the SteelSeries Engine 3 software, and is currently supported in CS: GO, Dota 2 and Minecraft.

The Rival 500 is quite expensive which is generally the case with MOBA mice because of the higher number of features and better build quality. The tactile feedback is currently the only implementation available in gaming mice so, if you're excited about trying it out, you will need to empty your wallet quite a lot.

—Abhijit Dey

## Dell Inspiron 7567 Gaming

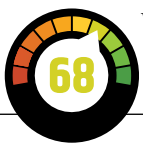

### An entry-level gamer's everyday notebook

**L**ast year, the Dell Inspiron gaming was one of the best entry level gaming laptops we laid our hands on and Dell continues that this year as well. Powered by an Intel Core i7-7700HQ and featuring a NVIDIA GeForce GTX 1050Ti GPU, this new 7567 Gaming is the pretty powerful laptop. This means that it can munch through every triple AAA title without any issue, even with high and ultra settings. Games like Battlefield 1 averaged at 46fps at Ultra settings, which is quite remarkable.

Even with a powerful setup like this, the Dell 7567 maintains heat quite well and the max temperature recorded

was 51 degree Celsius in the middle of the keyboard. The battery on this machine lasted us over 10 hours of use in day-to-day work, like browsing and office work. If you like gaming on the go, the laptop will churn out 3-4 hours of gaming on full charge.

Although, everything is not well as the 1080p TN panel is just plain bad. You can only view your content or games head-on. This means that while it has the performance for gaming, the display just takes the life away from games.

Overall, the Dell Inspiron 7567 tries to be a lot more than just a gaming laptop and achieves some of it. It has amazing battery life and will suit your gaming needs if can overlook the display.

—Hardik Singh
