

us off a service faster than pushiness to sign up/subscribe/whatever. While it makes sense to try get people to sign up so that they can generate some \$\$\$, only sheeple will still use their site when a better alternative is available. So while both Wetransfer and Ge.tt offer pretty much the same functionality, we prefer the latter for it's non-pushiness and subjectively, better UX. Also the ability to begin downloading the file at the receiver's end *while* it's being uploaded.

Mainstream: Wikipedia as your presentation source (<https://www.wikipedia.org/>)

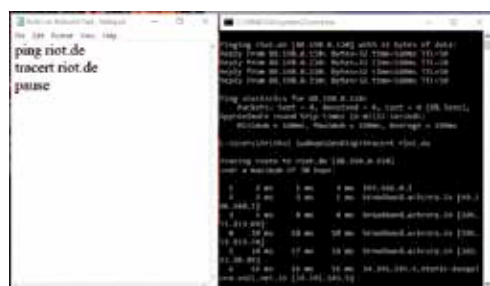

Geekier Alternative: Gwiki (<http://home.gwiki.io/>)

Because: Let's face it. Wikipedia is everyone's MVP for when you need filler text that looks somewhat relevant to whatever topic you are supposed to be presenting on, because who are we kidding, no one looks at presentations anyway unless you have some snazzy animations. But there's always going to be that fear that you missed a hyperlink or a [1] somewhere and your teacher/boss is gonna zero in on it. That's why Gwiki. It gives you just the plain text you need, correctly formatted so you can use it as filler in peace. Ok fine, it's for distraction free reading. Happy now?

Mainstream: uTorrent as your torrent client (<http://www.utorrent.com/>)

Geekier Alternative: qBittorrent (<https://www.qbittorrent.org/>)

Because: This one is a no brainer. The last good version of uTorrent without a hidden bitcoin miner that leveraged your CPU to mine coins and no security exploits was version 2.2.1 – released back in 2011. The current version is also infested with ads and requires you to be vigilant not to accidentally download malware. qBittorrent is lighter, completely open-source and generally does everything you'd want a torrent client to do, and it does it well. Deluge and Transmission are two other clients worth looking into but qBittorrent should suffice for most use cases.

Finally some proof for when you blame the lag

Screenshot for illustrating formatting. No judging please.

Mainstream: What's my IP (whatsmyip.com)

Geekier Alternative: I Can Haz IP (icanhazip.com)

Because: Sometimes, all you need is just your IP. You don't need to know who your ISP is, what are you accessing the internet from, Nada. Just those 12 numbers separated into 4 by periods, no frills. And exactly for those situations, there exists I Can Haz IP. .

Mainstream: Opening up Command Prompt to execute commands like tracert, ping and ipconfig

Geekier Alternative: Create a batch file that'll execute the commands for you when you open it.

Because: Opening up CMD to execute a command is actually painfully slow, if you think about it. Why should you suffer through it when you can achieve the same thing much faster? Open up notepad and type out each command you want your shortcut to perform, in separate lines. And if you want to look at the results, add pause in its own line at the end. Save this as a .bat file where ever you want. Opening it will execute the commands instantaneously without you having to do anything! As a bonus, you can set up a keyboard shortcut for even more functionality. Navigate to the shortcut's properties, and in the shortcut tab you can set the hotkey.

Mainstream: Alexa for Website Ranking (<http://www.alexa.com>)

Geekier Alternative: SimilarWeb (<https://www.similarweb.com/>)

Because: Frankly speaking, Alexa is quite rubbish. It logs it's data from only people who have its toolbar installed and since only a particular demographic (businesses and the tech illiterate) have the misfortune to have their browsers infested with toolbars, this ends up skewing the data quite a bit. While SimilarWeb isn't perfect; far from it. It's a wee bit pushy which we didn't like, but the service itself is better.
