

Sprig is shutting down

On-demand delivery services which blossomed a couple of years are facing a lot of challenges into making money. <http://dgit.in/SprigRIP>

India's phone subscribers

Indian smartphone subscribers to reach 810mn by 2021 with total mobile traffic of 45 Exabytes per month. <http://dgit.in/810by2021>

Community creation: About the creation:

WannaCry was possible by taking advantage of the SMB protocol flaw in systems. India was among the countries affected by the ransomware and to resolve this issue, WannaSmile was created by two friends. Indrajeet and Hrishikesh and created an online and offline version of their tool that took care of the SMB security flaw. Check out the tool at this Git repo: <http://dgit.in/WnaSmile>

About the creators:

Indrajeet Bhuyan and Hrishikesh Barman are 19 year old computer science engineering students who have a liking for security research. Indrajeet is actively always on the lookout for vulnerabilities on different web services. With his knowledge and interest in the sector, he was invited to several international security conferences including Toorcon Australia Andsec and Argentina. His friend Hrishikesh shares the same passion in this field, who also went on to learn web development and system admin solutions. While being a data science enthusiast, he loves contributing to open source.

days of Windows Mobile 6.0 so many times, then developing on account of Microsoft's wild claims would be like trusting Donald Trump for the Presidency. (Wait, you did that? Never mind.) And, it's just not about the number of apps in the Store. More often than not, if an app makes its way to the Windows Store it is utterly immature.

Also, this is not going to change in future. With Microsoft's amazing support for its Windows Phone 10 Mobile, it'd be stupid to invest any money on an UWP app, when you know people seldom use apps on PC. Just go through the Windows Store and Play Store, and compare the app usage patterns. And in that perspective, everything that is "cool" about Windows: Action Centre, Cortana, Holographic technology, everything becomes insignificant. There are no apps to make use of these features.

Let us also not be too easy with Chrome OS. Android apps still don't adapt to a large screen as expected, and the experience is far from satisfactory. But, all that these apps need is optimisation for larger screens. And, on further thought, waiting for developers to build apps definitely sucks more than optimisation of pre-existing touch-friendly apps.

The Android apps are secondary to the Chrome OS, since it has already established a name in the market with its simple browser-only approach. The future of OS apparently lies with the web. People don't download Facebook's app on Windows 10, because they don't need to, they have access to the full Facebook

website. Mobile browsers are not as powerful as their desktop siblings, and that's why we have apps. But, the obvious course of development shall be making the mobile browser powerful. Notifications for websites, and the recent development of Progressive Web Apps that mimic native apps, are steps in this regard. The best thing about Chrome is that it prioritises seamless browsing experience over anything else. And, even feature wise Chrome OS survived without any native apps, not only because web today is so amazing, but also because of its richly stocked webstore. Now, imagine your computing experience on a Windows 10 S machine: no Chrome, no Firefox, no Win32 apps. Nightmare, right?

To be frank, our quest for the ultimate Operating System is a work in progress, no matter what team you belong to. At present, we just need a simple, fast and yet functional operating system, just like the one in our mobile devices. Microsoft realised our needs, but, Windows 10 sadly isn't that operating system. Chrome OS could be. [4](#)
