

ARM's new Cortex A75 and A55 designs

Here's how things work in the mobile processor universe: Behind every smartphone chipset you see today, is a British company called ARM. So, when ARM says its new chipset designs are more powerful and efficient, that essentially gives everyone (OEMs and chipset makers alike) a chance to say the same. Samsung's 2017 versions of Mongoose cores and Qualcomm's newest Kryo designs are based on a custom Cortex A73/A72 design, while the low power Kryo cores on Qualcomm's new Snapdragon 660 chipset are based on ARM's Cortex A53 designs.

ARM doesn't sell its own chipsets, it sells intellectual rights to micro-architecture designs. Companies like Qualcomm, MediaTek and even Apple take that architecture and make their own changes to the same (with ARM's permission) to come up with Kryo, Helio, Mongoose or even Apple-Ax chipsets. When you see a smartphone with Cortex-A cores, it means ARM has designed the cores and they have been used just as ARM envisioned it.

The recent announcements about ARM's new Cortex A75 and Cortex A55 designs are significant for the mobile universe, including automotive technology, IoT and more. ARM promises improvements with these new designs and says they're designed with AI computing in mind.

Nokia's return to the Indian smartphone market

With the Microsoft era behind it, HMD Global takes the reigns of a brand that's run many a race and come out shining. The launch completes Nokia's return to market, but this time, strapping on with Android. The three new phones, Nokia 3, Nokia 5 and Nokia 6 are priced at Rs. 9,499, Rs. 12,899 and Rs. 14,999 respectively.

New pricing strategy is interesting, if not particularly impressive. The phones are cheaper than phones by Samsung or Sony, while they're more expensive compared to brands like Xiaomi and

Lenovo. So, HMD is essentially banking on Nokia's brand value, hoping consumers will choose Nokia over the sea of Chinese OEMs, while offering cheaper price tags to overcome Samsung.

Design, brand and really everything else aside, what would set Nokia apart from its competitors is the vanilla Android OS its phones offer. And if the company can truly stick to its promise of delivering speedy Android updates and security patches, they might have a breathing spot in our current jam-packed market.

What is Google's Daydream?

It's been about a full year since Google announced the Daydream

View headset and its very own Daydream platform. But now that it has finally come to India, we take a close look on what it is, and what Google plans for its virtual reality platform.

Qualcomm's new Snapdragon 450

Qualcomm Snapdragon 450 is reportedly a 14nm architecture

Octa-core chipset that could bring the efficiency of Snapdragon 625 to the Snapdragon 400 platform. The new low-powered chip could feature the same Adreno 506 GPU found in the Snapdragon 625.

AI-powered exoskeleton

The day when we start wearing exosuits (like the ones from Edge of Tomorrow), we could be closer to sci-fi than ever. This new AI-powered exoskeleton can learn from your steps using algorithms and reduce the amount of energy needed to walk or run.
