

# Glass X – Universal Screen Protector

**Goal: \$3,500**

**Deadline:** July 30, 2017

**G**lass X, the liquid screen protector takes the 'go with the flow' advice way too seriously. It's a one size fits all solution for smartphones, watches, tablets and laptops alike. It's virtually invisible and durable too with a 9H hardness rating. It's relatively simple to apply on the screen and it's shatter-proof and scratch-proof. With a thickness equal to one-thousandth of a human hair, it's extremely thin and light too. It's effective against keys, knives and sharp nails. They claim that the protection will last as long as the device and will not start yellowing. This would be particularly welcomed by phones with curved displays like the Samsung Galaxy S7 edge or the bezel less S8.

# Aryzon

Goal: €25,000

**Deadline:** July 3, 2017

**A**ryzon is an immersive 3D AR product aimed at changing your perception and how you interact with your environs. The whole unit is packed in a cardboard box for cost cutting and easy shipping. The smartphone camera is used to create a vivid AR experience. Using a combination of a mirror, lightweight stereoscopic lenses and a combiner glass, the stereo image is brought to life. This holographic image has a wide Field of View (horizontal - 35° for one eye and vertical - 20°), apparently better than that of

the Hololens. It uses the Unity engine and also has a dedicated app which will act as a sharing hub as well. It has the potential to bring about ground-breaking revolutions in optical learning and hands-on.

# Magical Microbes – STEM Pack

**Goal: \$5,000**

**Deadline:** August 1, 2017

**T**he next instalment of the Magical Microbes series is here and this time includes DoughLab along with the previously successful MudWatt as a complete STEM pack. The MudWatt creates clean energy from microbes that naturally live in the soil – your very own geo-energy pet. As the microbe community grows, the LED indicator in the setup will begin blinking faster and faster from the power generated. The new addition, DoughLab lets kids experiment with dough and bread. Kids can create their very own recipes and have a yeast race (yes, it's actually a thing) to see which recipe inflates the attached glove the fastest. We makers hope to mould tomorrow's pioneers by cultivating a scientific mind set. Oh, there's a cute yeasty plush toy included too.

# WhiteFox

**Goal: \$100,000**

**Deadline:** July 26, 2017

**T**he WhiteFox is the direct descendant of the BrownFox. It is an original DIY keyboard kit with many customisable functions and layouts. It comes under open source hardware due to the many modification options available to one and all. It is fully programmable, 65% mechanical and comes with an aircraft grade Aluminium frame. The Aluminium plate provides a small amount of flex to make it easy on the fingers. It is also one of the few boards where the mounting screws are flush with top of the plate. It's fade, dust and fingerprint resistant. The light and elegant aesthetics are courtesy of Matteo Spinelli, the famous Italian mechanical keyboard designer.
