Paint 3D

Added in the Creator's Update, this tool is much more than the right brush size and paint bucket.

Arnab Mukherjee | arnab@digit.in

FOR THOSE OF YOU unfamiliar with the Windows Creator's Update and its features, Microsoft has introduced a bunch of new stuff with the latest update to their operating system. Among these is Paint 3D, the much-talked about, latest version of the age old MS Paint. It wouldn't be enough to call it just an upgrade because now the application supports a ton of entirely new abilities including, mainly, basic 3D modelling. Now, with Paint 3D you can not only make 2D art but also doodle in 3D and many other things that make it way more powerful than the humble Microsoft Paint. So, if you're already on the Creator's Update, let's get started.

01

GETTING STARTED

Firing up Paint 3D, you'll be presented with a bunch of tips and video guides to help you. But instead of getting lost in that right away, we'd recommend getting your hands dirty.

Hit 'New' and you'll have a blank canvas proper up on a 3D grid extending on all sides. On the right you'll see a host of brush choices. You're currently in the 'Art tools' section, highlighted by the brush on the black bar on top.

These brushes let you define your brush stroke with options like Calligraphy pen, oil brush, watercolour and more. Of course, you also get the standard eraser and fill colour tool right here.

Before you start doodling, choose the thickness and the opacity from the sliders below the brushes to get the exact brush stroke that you want. You can also choose the finish from the drop down menu below that, with alternatives such as Matte, Gloss, Dull Metal and Polished metal. The colour selection is pretty much the same as its older, non-3D counterpart.

02

DOODLE AWAY

Doodling is what MS Paint was all about. After all, how many of us had the patience to carefully put in pixel-level details into a bitmap image? Not too many. Paint 3D retains the same emphasis on doodling, but lets you do a lot more.

To start off, doodle something onto the canvas (hopefully better than what we managed), choosing whichever brush strokes you feel like. This doodle can be converted to a sticker and placed on other 3D objects. To do that, click on the 'Select' button on the top right, and drag the selection box around your doodle. Once you've created the box, you should see new options underneath the select button – namely, Make 3D and Magic Select.

Hitting 'Make 3D' will convert your entire selection into a 3D object, it's 'Magic Select' that makes this section useful. Click on it and Paint 3D will automatically select the part of your doodle that it recognises as a distinct object. You also have the option to add/remove parts of your doodle in this selection by selecting the respective mode on the right and drawing over the areas you want to add/remove. Once you're satisfied with the selection, you can hit the green tick at the bottom to convert your selection into a separate layer. Now you can convert this into a sticker by hitting the 'Make Sticker' button on the right and place it on 3D objects.

But where will those objects come from?
