

Real life glass frog, almost

An exhibitionist frog has recently been discovered in Ecuador with its heart, kidney and urinary bladder clearly visible. <http://dgit.in/TransFrog>

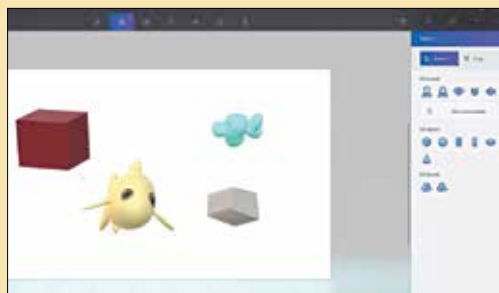

Mouse sperm survives space

A mouse sperm survived a 9-month long journey in space exposed to 150x radiation on earth to give birth to healthy mice <http://dgit.in/Spacemice>

03 GOING 3D

They'll come from the '3D objects' tab. Now this is where the real fun in Paint 3D begins. Before we proceed, you might have noticed that the doodle you made in the last section has disappeared. Don't worry, it is not gone forever and we'll show you how to bring it back as a sticker once we are done with this section.

On the right, you'll see a lot of entirely new features. The 3D models section lets you add pre-designed 3D models into your scene. Stuff like a doodle-ish male figurine, some pets are already there and you can find more by

clicking on 'Get more models' which will take you to the Remix 3D portal. We will cover that in greater detail later in this article.

The 3D objects are standard shapes like Cube, Sphere, Cylinder, Capsule, Doughnut and Cone. The 3D doodle section offers you two modes – sharp edge and soft edge. In both modes, you make a 2D doodle that is converted to 3D. The soft edge mode just rounds the edges on your doodle – so ideal for making clouds or cotton candy.

04 MOVING AROUND

Irrespective of what 3D objects you've made so far, you get a few standard options to interact with them. Tap the 'Select' button and then click on an object. You can obviously drag the objects around to move them along the x and y axes. In addition to that, you'll get four options, one on each side of the object. Three of those are for rotation along each of the axes, and the last on the left is for movement on the z axes. Using this option will change the perspective to an isometric view, as long as you are using the tool, to move the object in front of or behind other objects. This is pretty useful if you're working on an entire scene.

05 RESIZING AND WORKING ON THE CANVAS

You can disable or hide the canvas by going to 'Canvas' on the top bar and toggling 'Show Canvas' or 'Transparent Canvas' off and on respectively. This section also allows to resize your canvas. Resizing

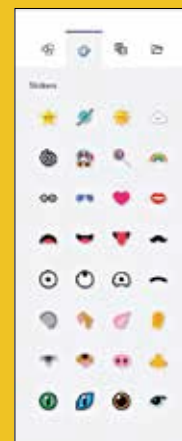

your 3D objects is also dependent on the perspective. So, using the rotation tools we had mentioned earlier, first rotate the object such that the face that is to stay unchanged should be facing you. Now stretch any of the edges to widen the object in that particular direction. This works on complex 3D objects as well.

06 3D ART TOOLS AND STICKERS

All the art tools mentioned earlier work with the 3D objects in a manner that is akin to painting on them directly. With the 3D model in place, choose the brush and colour you want and simply paint over the object. Since the object is in three dimensions, you will have to rotate it to cover it entirely.

You also get the option to use stickers on your models. There are standard shapes like squares, stars that you can choose, or drag a bunch of premade stickers from a wacky collection. Check out the last tab in the Sticker window – Custom Stickers. Here, you'll find any stickers you've made in the current session.

07 GET PRE-MADE CUSTOM 3D MODELS

The Remix 3D portal, accessible from the rightmost tab on the top row, is one of the most exciting things about the Paint 3D app. It is the online community where people upload their designs from Paint 3D. The models are nicely divided into sections like Staff Picks, Inspiration (which comprises models from certain categories, like Toys, Steampunk etc), Community Designs and Challenges. The challenges are quite similar to the inspiration section – what makes it differ is the task associated with the set, for example, Halloween scene, build a bot etc. [\[1\]](#)
