Cyber lab rat Ukraine?

What was at first just a blackout, seems to be a case of Russia using Ukraine as a Cyberwar testing ground. <http://digit.in/Ukraine>

Sennheiser HD 200 Pro

Comfortably okay

The Sennheiser HD 200 Pro seems to aim for the comfort game. It's ultra lightweight and the clamping pressure is just the right amount. This makes long listening sessions a breeze. On the other hand, the construction feels flimsy, reminiscent of the older HD 428, which served me quite well until they broke. The pattern on the earcups looks nice but the quality the earpad material itself could have been better. One of the few things that doesn't pull down the build and design score is the fact that it has a really long cord.

The sound signature is mostly neutral but the bass is further subdued. Cymbals, wind chimes and other high sounds are reproduced well. But the trouble is that most of our test tracks sounded too up front with a narrow soundstage. Live music doesn't sound full bodied and the overall presentation is restrained. For example, the bass guitar notes at the start of *Hate Song* by *Porcupine Tree* lacked depth but the cymbal following the bass notes is nice and sparkly. Acoustic tracks sound nice as well.

Even if the HD 200 Pro may positioned as a studio monitor, its aural performance and more importantly build quality isn't reference grade.

You'd do better with the Audio-Technica M50x (by upping your budget) or Sennheiser's own 280 Pro (around ₹ 8000 right now), unless comfort is more of a priority, which is the one thing the HD 200 Pro excels at. Although, the reasonably comfortable Audio-Technica ATH-AD500X is selling currently at only ₹800 more on Amazon.

—Siddharth Parwatay

HP Omen 870-260In

Press start for 1080p gaming

The HP Omen may look like a revamped HP workstation at first sight, but in reality it is a full fledged gaming PC. It does not feature top tier gaming hardware nor does it have the best in class design, but it performs well as long as you are gaming on a 1080p display. The performance of this machine comes from an Intel Core i7-7700K processor which is clubbed with an NVIDIA GeForce GTX 1060 (3 GB) GPU. There's 16GB of RAM on the machine and a dual storage system, which enables the HP Omen 870-260In to run all major AAA gaming titles without any major hiccups.

We even hooked this whole setup with our resident 2K display from Asus and the PC gobbled almost every game we threw at it with ease. There are no heating issues on the machine and since the CPU is water cooled, enthusiasts will have a larger overhead while overclocking. Moreover, almost all internal components in this desktop are user replaceable.

The design of the machine looks different from the usual red and black paint scheme we see on present gaming devices. Instead, the Omen desktop relies on a brushed aluminum front fascia and led inserts to lure the gamer in you. However, we think going with the current trend, HP could have made the whole unit smaller.

Overall, the HP Omen desktop is a good alternative to a regular gaming desktop. It is a bit overpriced considering the hardware. You do get ample performance, an RGB studded case and peace of mind for 3 years at least.

—Hardik Singh
