

Uber new driver retention drops

The retention rate for new drivers in the US for Uber has seen a sharp drop according to recent findings <http://dgit.in/Uberdown>

Road rash in the US

An angry motorcyclist's roadrage kicks leads to 2 cars crashing on the freeway in California causing one truck to topple. <http://dgit.in/roadrashUS>

Bose SoundLink Revolve+

Good sounding audio lantern

The Bose SoundLink Revolve+ is the latest Bluetooth speaker

to join the portable audio party. Shaped like a retro lantern, the Revolve+ does make a difference with its design. It looks quite suave, and the aluminium-rubber build is quite classy. You also get a loop to hang it, and like many Bluetooth speakers nowadays, the SoundLink Revolve+ plays 360-degree audio.

It uses a downward-facing transducer along with bottom-placed deflectors to play omnidirectional audio. Bass performance is aided by dual passive radiators, and the low frequency performance here is commendable. The bass is deep, clean and well detailed, and holds composure well across tracks of varying genres. The mid frequencies are slightly shallow, but do not really sound muted. It is only a tad lacking in depth and details in comparison to the lows and highs, and the overall audio clarity is quite impressive.

The SoundLink Revolve+ does well to deliver uniform directional audio without spatial bias. It also plays quite loud, and does well to control distortion of sound. Alongside looking suave, the speaker also resists shock and water, and you can use Google Now or Siri as well. It pairs quite easily and smoothly, and while battery life can go up to nearly 14 hours of playback, there is a discernible drop in audio levels below 20% power.

Despite that, the Bose SoundLink Revolve+ is a very good portable wireless speaker, at par with its previous best SoundLink, the SoundLink III.

—Souvik Das

SPECIFICATIONS

DRIVERS: Down-facing transducer | BASS DELIVERY: Dual passive radiators | BATTERY: 16 hours | RANGE: 30 feet | WEIGHT: 900 grams

Digisol DG-BR5400QAC Wi-Fi Router

Economical AC1200 router with a few kinks

Wireless AC is present in almost each and every mobile

computing device and that has been followed by a slew of networking devices catering to the high bandwidth needs. The Digisol DG-BR5400QAC aims to provide a good feature set for a very economical price tag. And when you hear such a statement, you'd assume there to be a few corners cut.

There's no intention of looking aesthetically pleasing. It's all about providing a good amount of bandwidth headroom while ensuring signal strength as well. For the latter, it has four 5 dBi antennae in each of the corners. Two of these are for the 2.4 GHz band while the other two are for the 5 GHz band. We would have preferred if the antennae sprouted out from the sides rather than from the top. Also they only rotate about 300 degrees which for a top-mounted antenna is fine.

On the inside, we see that Digisol has used cheap electrolytic capacitors for the power filters. While they are rated for 25V which is more than double the 12V rail, this could have easily been switched with better quality ones or multiple ceramics in parallel. The firmware seems to have been slightly tidied up but we'd still expect a little more in terms of granular level of control.

Performance wise, the router is pretty decent with uplink/downlink speeds on the 2.4 GHz hover around 163 MBps while on the 5 GHz band they hover around 457 MBps. For the price, this is a pretty decent router. All they need to do is improve the build quality a little.
