Ubiquiti AmpliFi HD Mesh Wi-Fi system

Enterprise grade Wi-Fi made simple

Price
₹49,999

V

ery few have heard of Ubiquiti Networks, a company that

builds enterprise grade hardware but not many have experienced it. We consider ourselves fortunate to be among the very few to be completely blown away by the performance that this mesh networking system offers. Let's get one thing out of the way, this device is built to cater to large homes and SMBs which makes it a little pricey. The unit comes with one base station and two mesh points, each of which require their own wall socket to be powered. Setting the system up is one of the easiest experiences that we've had. On top of that, it features a very aesthetically pleasing design. The base station can easily pass off for a show-piece and the mesh points can be hidden anywhere in the house.

Performance wise, you do take a setback with the Amplifi HD as compared to a single device router. In fact, if you bought three AC3200 routers, you can set up a similar configuration with a lot more effort and a good amount of networking know how to get much better performance overall.

MSI VR One Virtual Reality Backpack

For the early adopters

Price
₹1,79,990

G

etting into the VR game early has its fair share of issues.

There's a humongous mess of cables dangling from your HDM making your head into a tether ball, setting up the devices aren't as easy as sticking a USB flash drive into your machine. And the need for a powerful machine to run VR HMDs means you are restricted to a square patch in your home. VR backpacks aim to solve such issues and the MSI VROne backpack is one of many such devices but the only one selling in India at the moment.

It's got two battery packs to power an Intel Core i7-7820HQ along with an NVIDIA GTX 1060. These battery packs are swappable and the unit has a physical battery level indicator to make it easier for users to know when to swap out. It has HMD connectors on the top which makes it really easy to manage cables and the entire thing is built to be a backpack which isn't so bad to use for extended periods, your doctor, though, might have a different opinion. Setting up the unit is a teensy bit difficult since you will have to use Remote Desktop for the initial Vive setup but once that's done, everything is a breeze. This is because the second display port is the not so popular Mini-DP. Performance wise, the VROne checks all the boxes for most arcade games but should you try something a little more intensive such as battle scenes in Elite Dangerous or the upcoming Fallout 4 VR then the GTX 1060 isn't up to the mark. Hopefully, MSI will have a SKU with a more powerful graphics card and a bigger battery soon.
