

South Korea to get travel boost

HTT has found a client in South Korea and 2 associated educational institutes to launch the HyperTube Express. <http://dgit.in/HyperSK>

Et tu Caesar?

Caesar's Last Breath' documents the history of gases and how you could be inhaling Caesar's last breath among others. <http://dgit.in/Ettucaesar>

emacs being the weird kid as usual

To exit Vim, you have these options:

:q - quit
:q! - quit discarding changes
:wq - save and quit

Modes

Vim comes with six modes, "normal", "insert", "command-line", "ex-mode", "select" and "visual". Out of which the "normal" and "insert" are the primary modes and what we will be looking at. To know about a mode, type the following when in normal mode.

:h name-mode

Normal Mode

In this mode, most of the keys are bound to commands that manipulate text. Press "Esc" to go back to this mode from insert mode. Vim starts in this mode by default which is why you can't start typing away immediately. This mode is called "normal" for a reason, you should be on this mode most of the time and use "insert" mode only

The Vim intro page

for short bursts of inserting text. This is a core philosophy of Vim and you will understand this in the subsequent sections here.

Insert Mode

Insert mode is used to insert text. Simple as that. Vim provides a variety of ways, depending on different use cases, to enter insert mode. The simplest method is by pressing 'i' when in normal mode.

The "Vim" Language

Motions

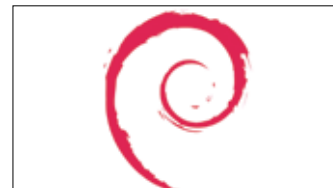

The foremost skill that has to be learnt in any editor is navigation. How do you navigate your way through a document in a normal editor? You move your hand from the keyboard to the mouse, scroll through the document until you find the desired location.

In Vim, you use nifty commands called motions to navigate efficiently. Here are a few of the commands -

- 'w' - Moves to the next word from current cursor position. Alternatively, 'b' moves the cursor to the previous word. Vim marks the end of a word with 'space' and symbols. In the following snippet, 'w' would move the cursor to '[' not 'i'. To make Vim treat only spaces as end of line, use 'W' (shift+w).

```
int array [5] is an array;
```

*CODING MATTERS

*Scratch 2.0 Offline In Raspbian

An update to Raspbian has the ability to run Scratch 2.0 locally, without the need for a browser connection, and with custom extensions which allows the user to control the Pi's GPIO pins. <http://dgit.in/ScratchRsp>

*\$2 Million To Reinvent The Internet

This US-only contest comes from Mozilla and the National Science Foundation who have joined forces to call for big ideas that will keep the web accessible, decentralized and resilient. <http://dgit.in/MzilaChal>

*Google Releases Object Detector Nets For Mobile

MobileNets are a small set of neural network models pre-trained to identify objects. In theory this software should be of great value, but Google is making it available for free. <http://dgit.in/MbileNets>
