

PM Modi meets with top CEOs

PM Modi has a roundtable with 21 top US corporate leaders including Tim Cook, Sundar Pichai and Jeff Bezos at DC. <http://dgit.in/ModiGee>

Windows 10 device tracking

Following in the footsteps of Apple, Microsoft is looking to patent a tracking feature that does not require the internet. <http://dgit.in/trackWin>

*Fun fact:

The Vim command `:g/re/p` which globally (g) prints(p) lines containing the regular expression(re) is where the now ubiquitous Unix command, `'grep'` got its name.

numbered motions which we saw earlier are examples of modifiers. Other important modifiers are -

- > `'i'` - inside
- > `'a'` - around

Example commands to illustrate the modular syntax:

- `'dw'` - deletes from the current cursor position to next word.
- `'yiw'` - copies the word under the cursor.

It's that simple! Now, if you learn some new motion, you've learned how to do 3 more operations in Vim. This concept is best explained by expert developer, Mike Kozlowski, "This philosophy of minimalist commands that can be composed together is the fundamental originating philosophy of Unix, and Vim exemplifies it like no other editor." If this is difficult to grasp, picture the syntax as a language, where actions are verbs, modifiers are adjectives and motions are subjects.

To repeat a command, just use `.'` instead of typing it out again. Now that you've learned a bit, go get your hands dirty. In case you messed up, here are two useful commands to undo -

- `'u'` - The "ctrl-z" of Vim.
- `":earlier 10m"` - Goes to the state of the document 10 minutes ago. You can use `'s'`, `'h'` or `'d'` instead of `'m'` to move back in seconds, hours or days respectively.

CASE STUDY

Let's say you have a variable whose name you want to change to something more descriptive.

Before	After
<code>int var;</code>	<code>int variable;</code>
<code>var = 420;</code>	<code>variable = 420;</code>
<code>func(var);</code>	<code>func(variable);</code>
<code>Char notvar;</code>	<code>char notvar;</code>

1. Enter `'/var'` to search for the first occurrence of `"var"`.
2. Use `'cw'` to change it to `"variable"`.
3. Tap `'n'` to go to the next occurrence and `.'` to repeat the last edit.

This is similar to the "find and replace" function present in many editors. However, there is a problem. This command will also change the `notvar` variable. Earlier, we discussed that `/` also supports pattern matching with regex support. Just type `\<var\>` (the regex for the word var) instead and Vim will ignore the undesirable case. This is a much faster and cleaner method compared to the "find and replace" function, where you would have to manually skip the undesirable cases. An EVEN faster way to do this would be with the following command `:%s/\<var\>/variable/g`

That's it! This one line is all that is needed to do the job. We'll let you figure this one out yourself (HINT: Enter `:h substitute`).

GOING FURTHER

That's all folks! Pat yourself on the back, you've now successfully learned the basics of Vim.

There are thousands of resources out there from where you can further your knowledge. The best one is probably Vim's own documentation which you can access with a simple `':h'`. ProTip: Spend five minutes every day going through the documentation, learning and memorizing one new command and in no time you'll be an expert at this.

Vim is frustrating at first, but that's only because you're relearning how to type. Patience is key. Alternatively, you can use the GUI versions of Vim so that you can gradually slip into the Vim philosophy. They support the mouse and work like a conventional editor. Initially, you will use the familiar mouse to select text and `"ctrl-c"` and `"ctrl-v"` to copy and paste. Then, gradually you will begin using `yiw` and `p`, instead. There are many GUI versions out there, but the best ones are gVim for Windows and Ubuntu and MacVim for macOS. Try them out and let us know how it feels. 

*POINTERS

>>Interesting developer videos

*Intro to NeoVim

NeoVim is an extension of Vim that has a many modern features. <http://dgit.in/NeoVim>

*Violin and Vim

A seminar on correct posture and finger motion for good typing. <http://dgit.in/ViolVim>
