

SUPERCHARGING YOUR SMARTPHONOGRAPHY

Because it's the camera we all have...

Prithvi Sudan | feedback@digit.in

Increasingly, our smartphones are becoming the first things we reach for when we want to immortalize a moment. Here are some ways to squeeze out some extra quality from those shots.

HARDWARE EXTERNAL LENSES

No we aren't talking about those cheap pieces of plastic that you struggle to hold to the back of your phone... There are actual DSLR-esque

Please don't complain about camera bumps

lenses produced by Sony that are specifically meant for your smartphone. They fix onto the back of your smartphone and bring amazing features usually reserved for much bigger and bulkier cameras, such as a huge sensor and true optical zoom, and also improve existing features such as Optical Image Stabilization and post-shot dynamic range correction. There are also some other nifty features such as a remote control and wireless sharing. Though we wouldn't call them overpriced, they are expensive. Check out our list at <http://digit.in/PhnLens>

GRIPPING AIDS

These days, the flagship phones pack some truly amazing hardware and deliver on some good phones. A full-size camera is infinitely more comfortable to hold and more stable to

shoot than a puny smartphone, and the results show. Even though tweaks like OIS take care of minor twitches, having a better grip on your camera makes the whole process simpler and better. Enter the Beastgrip (<http://digit.in/bstgrip>). It's sort of a chassis mount for your phone that lets you hold it the same way you would a bigger camera. They also bundle it in with a few smaller lenses that go behind your phone to allow for better photos like a fisheye lens and a wide angle lens. It's pricey, starting at \$140 for

It looks more complicated than it is

just the grip, but it's worth it – especially if you are going to use it in rough, jostling conditions.

MOVIE SHOOTING SIMPLIFIED

Dji is well known for their excellent drones and more than that, the excellent footage that their drones shoot. Those buttery smooth, ultra stable, sweeping shots of landscape are quickly becoming the first thing people think of when they hear the word drone. And Dji has brought that technology out for phones as well. Meet the Dji Osmo (<http://digit.in/hnddron>). It's a gimbal on which you can mount your phone and shoot video with the included camcorder. It keeps the camera flat and steady, no matter how much you move to give you that same stabilized footage as their drones. It comes with a Zemuse X3 – capable of shooting 4K video at 30 or 50 fps
