

and 12 MP stills, and it's completely modular, meaning that you can swap it out for other compatible Zenmuse modules. It takes microSD cards upto 64 GB and it's pretty light at around 230 grams. If smooth stable footage is one of your pet peeves, you should definitely look into getting one. And talking about stability, we can't help but go off topic and share Mercedes' ad (<http://dgit.in/benzAd>) with you. Watch it.

MANUAL CAMERA

Manual Camera is a great little app that every photography geek must have in their arsenal. It opens up generally locked settings on your phone, such as Focus Distance and Shutter Speed, so that you can fiddle around with them to compose and get that perfect shot. To top it all off, it shoots in RAW as well! It's pretty fast and snappy and while the UI doesn't look as neat or clean as we would like, it gets its job done. What we are most disappointed about is the ₹210 asking price. It's a little steep but if your primary camera is your phone and the lack of options hurt you, it's worth a look at. Check it out at <http://dgit.in/manualcam>

FILTERS AREN'T ALL BAD

Instagram has given filters a bad name – and it's not even their fault. People just slap on the first filter they see with no regard to see if it makes the photo look better or not (Maybe this is the reason why Clarendon is the number one filter in the world – it's the first filter in Instagram's default lineup) But when a filter is used correctly, it can truly enhance how a photo looks. Or get some truly comical shots out of everyday life. Camerino+ is a camera that lets

you shoot photos and videos with filters pre-applied. You can choose your pick from Spkto, Morfo and other fun unpronounceable names. It also has some manual controls and lets you shoot both slo-mo and extra fast videos (Not 940 fps slo-mo though) Pick it up on the Play Store for ₹50 at <http://dgit.in/FltrCam>

TOUCHRETOUCH

Ever shoot a great photo just to find out that you have that one thing in the frame that detracts from the whole shebang? Don't fret, for a solution is at hand. TouchRetouch allows you to easily remove unwanted elements in a photo. You have plenty of options like line removal, object removal and quick brush – and it's precise enough to remove just the smaller stuff too (like acne). It also has a clone stamp, to replicate objects that you do want in the photo. Quite handy to fix up any great photos with minor flaws. It's available on both the Play Store (<http://dgit.in/TchReTch>) and the App Store (<http://dgit.in/iOSTchReTch>) for ₹130 and ₹160 respectively.

FILTERSTORM NEUE

This one is for the #iPhoneography crowd. Filterstorm Neue is a very powerful editor that can handle RAW footage, no problem. You can play around with masking curves, color blending and even add in a watermark if you want to. The app is also very well written and it leverages your iPhone's GPU rather than the CPU, making it extremely fast to use. It also looks pretty nice, with semi-transparent floating labels to help even newbies to quickly figure out the controls. There are some small things that aren't readily noticeable – such as tapping to offset whatever brush you are using so that you can see the part you are working on, that all combine together to make this one very nice editor that is quite nice to use. It costs \$4 over at the App Store (<http://dgit.in/FiltrStrm>)

ADOBE PHOTOSHOP FIX

Say what you will, Adobe usually ends up making some good products and their mobile platform is no different. Adobe Photoshop Fix is intended as a way to get your photos retouched and restored on the go and it delivers. It has a whole suite of features, from defocusing to face-specific edits all packaged into a very polished app. It isn't meant as a powerful image editor and we can live with that, but the limited functionality it does offer is very good and it is definitely worth having. Download it on the Play Store (<http://dgit.in/FotoshpFix>) and App Store (<http://dgit.in/iOSFotoFix>) for free!
