

Bataan Memorial Death March

100 year old veteran Ben Kardon who survived the Bataan Death March still marches on to pay tribute to the fallen souls <http://digit.in/100WWtwo>

Fat injecting algae

An algae modified by dropping the activity of a single gene enables it to put half of its carbon into biofuel as fat. <http://digit.in/Algaebio>

bioprinted limbs didn't come cheap and his dad's health was priority.

He spotted his dad dozing at the reception as he was signing his name at the entrance. There were a few things that us humans aren't in a hurry to cure, and dozing at receptions was one of them. Even though there's was the first appointment, some others were already there. Virtual presence markers indicated that the queue was full for the day.

"Number 101, please proceed to room 3C." That was their call.

The OPD section looked fairly similar to the ones of years gone by, albeit with a couple of bionic limbs and partial exoskeletons here and there. Since the advent of bioprinted organs, there has been a rapid visible decline in external medical augmentations like exoskeletons and bionic limbs. The new thing was almost as good as natural and apparently lasted for ages – without needing maintenance. As long as the long term costs were down, people like him would be thankful for any medico-technical advancement that came their way. Even though bioprinted organs weren't there exactly, the dropping prices indicated that they would be there soon, just like exoskeletons and bionic limbs before them.

"Welcome, Mr. Gupta. How have you been?" The doctor addressed his father while simultaneously bringing up his case data on the wall to their left. It was a rhetorical question as she could see exactly how he has been since their last visit, thanks to the pre-authenticated network connections between her terminal and his father's identifier chip. The faint green glow behind his ear indicated the same.

"He's been getting irritated about the CloudPan stickers." Prashant told Dr. Anindita, knowing quite well that his father would say anything to get this over with as soon as possible.

"Ohho Mr. Gupta, don't you remember what happened when you stopped activating the automated drip because you didn't like it? It is only going to mess with your own sugar levels and that is not something we want to

happen, right? Right now, the stickers are the best, state-of-the-art medical technology when it comes to diabetes. Sure, it is not as great as the 3D printed internal organ replacements that are being tried abroad, but those things are still dicey anyway, if you ask me. Moreover, this method is unintrusive, and it doesn't even require you to do anything except changing the sticker every couple of days when it changes colour. Technology is here to help you, not to hurt you. I'll give you an example"

She tapped a few buttons on her screen and the entire setup changed to throw up a hologram of Mr. Gupta at the centre of the room. The hologram showed a complete biological assessment of his body.

Medical holograms are already helping doctors greatly

"This is you, right now. With a few swipes, like this, I can check information that would have required me to wait for at least a few days even 5 years ago – your lipid profile, sugar levels, even orthopaedic and neural data is accessible. I am sure you remember the time when lives were lost because reports were delayed. It is because of technology that we are beyond that right now.", Dr. Anindita said while signing off on renewals for the patches on the screen before her, which would get them delivered by drones by the time they reach home.

She was right. Prashant remembered his final year project on the evolution of wearables. Once the initial hype about the wrist had died down, companies had focussed on more important and efficient zones like the ear, the chest leading

to discrete, accurate wearable devices that ensured the category's survival. Heck, even smartwatches and fitness trackers survived once the ability to set dynamic, person-specific goals were added to them. Medical education itself was changed over the years to incorporate more technology specific knowledge to doctors.

"Back in my day, we had to put some effort into taking our medicine - remembering timings, dosage and all those things. It's just making us lazy", complained his dad, gazing at the now receding hologram with an air of suspicion.

"Correction, Mr. Gupta. Now, even the lazy ones among us can't escape healthcare.", a smiling Dr. Anindita

slid a marker on her desk, indicating that the next patient could be brought in and that this session was over. As they got up to leave, the door slid open and the next patient glided in on a hoverchair. The lady was easily 6+ months pregnant, as indicated by both the bulge and the pregnancy wellness tracker on her belly.

On their way out of the clinic, Prashant swiped his hand over the payment terminal for the doctor's fee. As they boarded the cab, the display up front, along with the map, was also showing the notification that the stickers would be delivered in about 23 minutes. Looking at his dad next to him, he wondered if his inherent distrust of today's technology would ever be cured. Not everything had a cure... yet.
