

MOVIE

Wonder Woman

★★★★☆ | We watched Batman v Superman Dawn of Justice and actually liked it. Sue us. Unfortunately, the rest of the populace did not feel the same way. The DCEU was yet to see a movie that would be its so called saving grace against the onslaught that was Marvel. That was until Wonder Woman showed up.

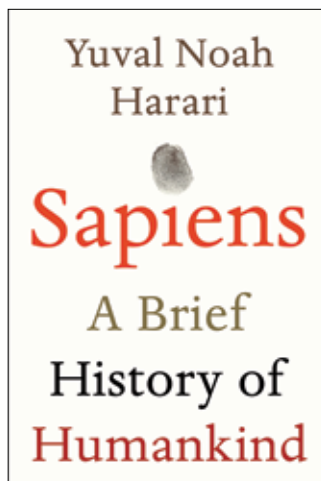

There's no denying that Wonder Woman is the best DCEU movie so far. Heck, people are arguing that it could be one of the best superhero movies period. The movie explores the origins of Diana, before she becomes the superhero that she now is. We learn of her upbringing in Themyscira and how she enters the world of man. Gal Gadot fits the role perfectly and does an excellent job of portraying the wonder of someone who was experiencing the world of man for the first time (also pointing out the weird customs and obvious distinctions in gender roles). The action scenes were really well choreographed and fun to watch. Patty Jenkins does a good job of portraying a powerful female lead character in a world led by men. There's also an unexpected turn of events towards the end of the movie. While not everyone was amused by it, we thought it was quite alright. All in all, Wonder Woman was a really good movie, easily one of the better superhero movies to ever grace the silver screen. The choice of actor for the role is also apt; Gal Gadot is now Wonder Woman. The same way Hugh Jackman will always be Wolverine.

TV SHOW

Sapiens

★★★★☆ | Cramming the entire 150,000 year history of humankind into a 400 page book would seem like a daunting task and more pertinently, a tedious read. But Yuval Harari does it with ease and at the same time, makes it a delight for the reader. The book takes you on a journey through time to the first proto humans that walked the earth. Then gives you a peek into the lives and evolutionary trajectories the various human species (other than sapiens) followed, their migration patterns and then to the "cognitive revolution" which springboarded our small branch of the human family to where it is today. We get insightful glimpses into our past, for instance, a rather imaginative look at a day in the life of a hunter gatherer. How the agricultural revolution spawned the next wave of human progress, right down to the building of empires and industrialisation. The book also takes a whimsical look at the future in which the author surmises mankind might even cheat death itself. As interesting as the book is, this is not the first book of its kind we've read. If you've read Guns Germs and Steel by Jared Diamond, this is the perfect follow up, especially since this book fills the gaps left by the Jared Diamond pertaining to India. A definite must read for anyone even remotely interested in history, technology, culture and science.

UP AND COMING

MOVIE

Spider-Man: Homecoming

We're getting a new Spider-Man movie. Again. What is this? The third reboot? Fourth? We've lost count. We first saw this Spider-Man in the

Avengers and well, we actually took a liking to him. Here's hoping this reboot doesn't tank.

GAME

Pyre

From the makers of Bastion and Transistor, both visually gorgeous games, comes Pyre. Both Bastion and Transistor are among

some of our favourite games, both for their visual appeal and amazing soundtrack. Hopefully, Pyre will come with the same charm and appeal.

TV SHOW

Game of Thrones Season 7

After being delayed by a few months, it's finally here, Season 7 of Game of Thrones will finally begin airing starting July 16, 2017. We're hyped

for this one and from what we've heard the premiere is going to be a long one. Are you prepared for the long night?
