

SECURITY WATCH

Microsoft SRD

Anounced last year, but now being made available for preview to developers is Microsoft's Security Risk Detection service. This is a service targeted at companies and developers who want to test their software product for not just security risks, but also bugs which can cause crashes and a lot of losses in terms of money. How this works is, you sign up and answer a whole host of questions about the software, and then upload a binary, after which the AI takes over. The AI will use all of Microsoft's developers' learning over the years, and some inventive new methods as well, to test and probe your software. What's more, it's not just for the Windows platform, but can also be used if you're developing for Linux! Head to <http://dgit.in/srdms> to find out more.

Hate Segway?

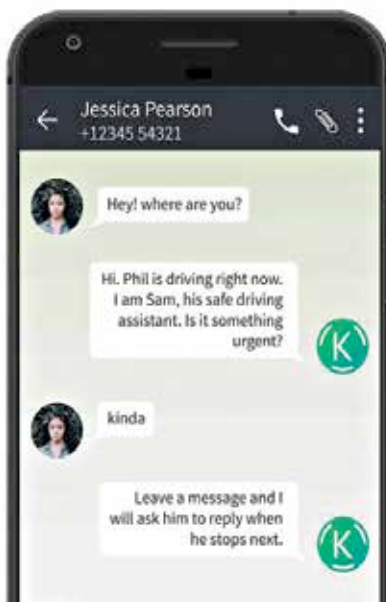

Many of us look at Segway riders as irritating and pompous, and can't wait for them to fall off. Heck, if you're looking for some fun, do a YouTube search for "Segway fails" and enjoy hours of entertainment. Unfortunately, the world missed out on a vulnerability in Segway's miniPRO Handsfree lineup. The miniPRO came with a mobile app that connected to your Segway and allowed you to control various things. For example, you could call it to you using your app. What this did, of course was bring wireless connections into play, and security company IO Active found a vulnerability that allowed a hacker to install malicious firmware, remote control the Segway, and even steal the device by tracking and controlling it! IOActive only made the announcement this month, after Segway had already fixed the vulnerability. Segway users who wipeout are now going to claim it was hackers that caused their embarrassment. Read more about the vulnerability here: <http://dgit.in/segwayhack>

APP WATCH

Kruizr

Road accidents have increased a lot over the years and one of the major factors behind that is the distraction posed by our smartphones. Kruizr is an app that wants to become your driving assistant and take care of everything else (smartphone related) so that you can keep your eyes and mind on the road. The app automatically detects when you're on the move and switches your phone into a driving friendly interface after your permission, offering some basic features like music control, frequent contacts, navigation

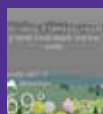

etc. But the USP of the app lies in the Kruizr bot that handles your calls and messages for you. And by messages, we mean WhatsApp, Messenger and the whole lot! The first time around, it did freak a couple of our friends out when a bot replied to their pings.

They are looking at integrating features specific to public transport as well as adding the ability to handle video and VOIP calls.

Apart from that, the app also has many other useful driving related features like remembering your last parking spot, details about your previous rides along with navigation to your saved addresses. Overall, we found it to be a very useful app.

Play Store: <http://dgit.in/Kruizr>

What the Forecast

Tired of boring, repetitive weather updates? Get this app and we promise you that you'll actually look forward to checking on the weather. With or without cuss words? Up to you. Beware, do not approach if you cannot handle sass.

Sqrrl

Mutual fund investments and other savings are not always easy to understand for everyone. Sqrrl takes care of the complicated stuff by just asking you your goals and a couple of other financial questions before showing you exactly how and where you should save. Neat, huh?

Protect Your Kid

If you have a kid around you by age or by behaviour - you can monitor and restrict their phone usage with this app. It lets you group a bunch of apps together and specify a total time allowed, among other things. A must have for parents.
