

**1000 times brighter**

Astronomers have discovered a galaxy 1000 times brighter than our Milky Way about 10K million light years away. <http://digit.in/inbrightestnight>

**Moon Base**

Elon Musk argues to have a base on moon to get humans more excited about space travel. <http://digit.in/muskonthemoon>

Taking care of you

Taking healthcare to the next level, these Indian startups are bringing the best in medical tech to you.

M

edical science and technology has always affected human lives closely. Whether it was the discovery of

penicillin or the first robotic surgery, developments in health-tech have made our lives longer, easier and overall better to live by making healthcare more effective and accessible. And right now, quite a few startups in India are continuing that goal with their innovative devices and services. In some cases, these startups are bringing world class technological innovations to the masses. In others, they are coming up with the technology that is being spread out to the world. From 3D printing to data analytics, here are some of the most interesting technological applications in Indian healthcare startups right now.

OSTEO3D

3D printing is neither a new technology nor are its applications in medical science. But in India, 3D printing hasn't yet reached popular healthcare the way it should. Two large factors contributing to that are the costs involved (mainly because high quality 3D printing is not

readily available in our country) and the lack of information available regarding the possibilities of the technology. Osteo3d is a startup that wants to change this entire situation.

The Bengaluru-based startup provides healthcare focussed 3D

Osteo3d®
3d printing healthcare®

printing services in a B2B model to doctors across the country. Among other things, it helps doctors plan surgeries and treatment better by making 3D printed guides and models. But that's not all they offer. For instance, in mid-2015, Osteo3d

manufactured a helmet for post surgical care in India's first endoscopic 'skull expansion' surgery. Normally, such a helmet would cost around 1.5 lakh and take 2-3 weeks to be made when manufactured abroad. With Osteo3d it was made for ₹20,000 in 3-4 days. More than 400 such cases are live in India right now.

Another strong aspect of their offering is the ease of use. Registered doctors can upload MRI and CT scans of their patients on the cloud based platform. Within minutes a 3D image of that part of the patient's anatomy is available to them, along with the cost that would be incurred in getting a 3D printed model made. For instance, a jaw area print typically costs around ₹2000-3000.
