ACCULI LABS

The demise of Rupam Das' father due to a heart attack despite repeated assurances from doctors regarding his survival prompted him to look deeper into ECG based diagnosis and other heart studies. Based on his learnings from this, he formulated a number of computer based ECG diagnosis algorithms, which he later combined into an analysis platform and subsequently, used it in his ECG acquisition device Lyfas.

Lyfas is an affordable and portable single-lead ECG device. It has features like biosignal processing, analysis and

streaming. Lyfas is capable of extracting multiple parameters, streaming the data live to doctors, and also performs real-time and cloud-based analysis.

Along with that, it can also get pulse readings from a patient. Combining this data with other information, it can effectively read blood pressure and blood sugar. Another avenue where its multiple readings and results are being put to use is medical underwriting. They are already working with HDFC Life and ICICI Prudential in this area.

Using platforms like Firmware, Edge, the cloud and Watson AI, Acculi Labs, the firm behind Lyfas, is able to offer customisable input abilities

STARthealth

Unitus Seed Fund organised StartHealth is a competition for healthcare startups with innovative solutions to existing problems in the areas of AI/Analytics, Devices/IoT and home health. The winner gets a prize money of ₹6lakhs along with access to non-dilutive funding from Unitus Seed Fund of about ₹4crore. This also gives them exposure to established global companies in healthcare and an opportunity to be entirely seed funded by Unitus. The fourth edition of StartHealth witnessed 186 startups applying. The winner of this edition was Bioscan Research, closely followed by Nanosniff Technologies.

- **Bioscan:** Ahmedabad-based Bioscan research has developed an affordable and handy non-invasive screening tool to detect intracranial bleeding. This device can be easily used by non-specialists, like paramedics and physicians, to quickly detect serious damage in the event of a road accident or any other eventuality that leads to traumatic brain injury. The best part? The device costs one-tenth the price of spectroscopes in the market and has given 100% successful results so far.
- **Nanosniff:** One of the most common reasons for death or disability from a heart attack is it being mistaken for a general gastric problem, leading to a delayed diagnosis and treatment. An affordable and accurate point-of-care device from Nanosniff technologies means to change that by utilising a microcantilever based biosensing system to detect the attack within the crucial first hour. This is done by looking for specific cardiac markers released in the blood during an attack. The startup has recently raised about ₹2 crore from crowdfunding platform 1Crowd.

for specialised cases – like those of diabetics, pregnant women and sportspersons. The final prototype of Lyfas is currently selling for ₹4,999, although prices are expected to come down as adoption increases and the product is improved before it launches for the mass market in a year.

HEALTHI

When was the last time you went for medical tests and actually understood the reports yourself? Medical reports aren't the most easily comprehensible documents in the world. In fact, even before that juncture, how do you even take the call on which reports to go for without going to a doctor? Healthi wants to provide the solution to all these problems using their cloud based platform.

To start off, you go and sign up on their website <https://www.healthi.in> and answer a brief questionnaire about your health. This questionnaire includes basic stuff like your height and weight, along with slightly advanced stuff like your blood

pressure, cholesterol levels etc. So if you want to increase the accuracy of the initial suggestions, it would be good to have your basic medical data handy. After the questionnaire, you're provided with a basic report on your health along with location-specific recommendations regarding the tests

that you should go for.

Healthi has tie-ups with many major diagnostic service providers in the country like Apollo

Clinic, SRL Labs, Medall Healthcare and more. The recommendations they offer are based on packages they have created with these providers. You can avail a package on the platform directly.

Once the tests are done, the information from the reports is directly updated on the Healthi dashboard and presented to you in an easily comprehensible manner. At this point, you can take your data and go to an offline physician, or you could stick with Healthi and consult one on their platform.
